

# HIGH-SPEED 3.3V 16K x 36 SYNCHRONOUS PIPELINED DUAL-PORT STATIC RAM WITH 3.3V OR 2.5V INTERFACE

**IDT70V3569S**

## Features:

- ◆ True Dual-Port memory cells which allow simultaneous access of the same memory location
- ◆ High-speed clock to data access
  - Commercial: 4.2/5/6ns (max.)
  - Industrial: 5ns (max)
- ◆ Pipelined output mode
- ◆ Counter enable and reset features
- ◆ Dual chip enables allow for depth expansion without additional logic
- ◆ Full synchronous operation on both ports
  - 7.5ns cycle time, 133MHz operation (9.6 Gbps bandwidth)
  - Fast 4.2ns clock to data out
  - 1.8ns setup to clock and 0.7ns hold on all control, data, and address inputs @ 133MHz

- Data input, address, byte enable and control registers
- Self-timed write allows fast cycle time
- ◆ Separate byte controls for multiplexed bus and bus matching compatibility
- ◆ LVTTTL-compatible, single 3.3V ( $\pm 150\text{mV}$ ) power supply for core
- ◆ LVTTTL-compatible, selectable 3.3V ( $\pm 150\text{mV}$ )/2.5V ( $\pm 125\text{mV}$ ) power supply for I/Os and control signals on each port
- ◆ Industrial temperature range (-40°C to +85°C) is available for selected speeds
- ◆ Available in a 208-pin Plastic Quad Flatpack (PQFP), 208-ball fine-pitch Ball Grid Array, and 256-pin Ball Grid Array
- ◆ Green parts available, see ordering instructions

## Functional Block Diagram

OCTOBER 2008

Description:

The IDT70V3569 is a high-speed 16K x 36 bit synchronous Dual-Port RAM. The memory array utilizes Dual-Port memory cells to allow simultaneous access of any address from both ports. Registers on control, data, and address inputs provide minimal setup and hold times. The timing latitude provided by this approach allows systems to be designed with very short cycle times. With an input data register, the IDT70V3569 has been optimized for applications having unidirectional or bidirectional data flow

in bursts. An automatic power down feature, controlled by  $\overline{CE}_0$  and  $CE_1$ , permits the on-chip circuitry of each port to enter a very low standby power mode.

The 70V3569 can support an operating voltage of either 3.3V or 2.5V on one or both ports, controllable by the OPT pins. The power supply for the core of the device (VDD) remains at 3.3V.

### NOTES:

- V<sub>DD</sub>, OPT<sub>x</sub>, and V<sub>DDOX</sub> must be set to appropriate operating levels prior to applying inputs on the I/Os and controls for that port.
- OPT<sub>x</sub> selects the operating voltage levels for the I/Os and controls on that port. If OPT<sub>x</sub> is set to VIH (3.3V), then that port's I/Os and controls will operate at 3.3V levels and V<sub>DDOX</sub> must be supplied at 3.3V. If OPT<sub>x</sub> is set to VIL (0V), then that port's I/Os and controls will operate at 2.5V levels and V<sub>DDOX</sub> must be supplied at 2.5V. The OPT pins are independent of one another—both ports can operate at 3.3V levels, both can operate at 2.5V levels, or either can operate at 3.3V with the other at 2.5V.

## NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- V<sub>TERM</sub> must not exceed V<sub>DD</sub> + 150mV for more than 25% of the cycle time or 4ns maximum, and is limited to ≤ 20mA for the period of V<sub>TERM</sub> ≥ V<sub>DD</sub> + 150mV.

## NOTES:

- V<sub>IL</sub> ≥ -1.5V for pulse width less than 10 ns.
- V<sub>TERM</sub> must not exceed V<sub>DDQ</sub> + 150mV.
- To select operation at 3.3V levels on the I/Os and controls of a given port, the OPT pin for that port must be set to V<sub>IH</sub> (3.3V), and V<sub>DDQX</sub> for that port must be supplied as indicated above.

**NOTES:**

1. All input signals are synchronous with respect to the clock except for the asynchronous Output Enable ( $\overline{OE}$ ).
2. These values are valid for either level of V<sub>DDO</sub> (3.3V/2.5V). See page 4 for details on selecting the desired I/O voltage levels for each port.

### Timing Waveform of Read Cycle for Pipelined Operation<sup>(2)</sup>

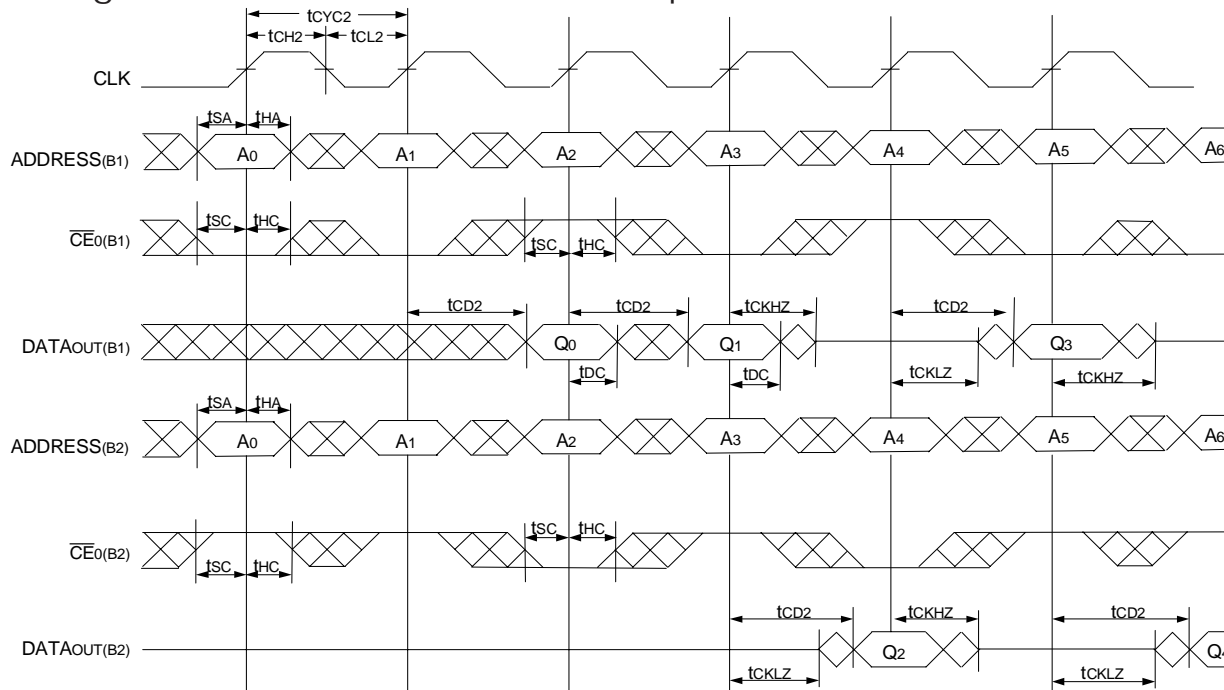

**NOTES:**

1.  $\overline{OE}$  is asynchronously controlled; all other inputs are synchronous to the rising clock edge.
2.  $\overline{ADS} = V_{IL}$ ,  $\overline{CNTEN}$  and  $\overline{CNRST} = V_{IH}$ .
3. The output is disabled (High-Impedance state) by  $\overline{CE}_0 = V_{IH}$ ,  $CE_1 = V_{IL}$ ,  $\overline{BE}_n = V_{IH}$  following the next rising edge of the clock. Refer to Truth Table 1.
4. Addresses do not have to be accessed sequentially since  $\overline{ADS} = V_{IL}$  constantly loads the address on the rising edge of the CLK; numbers are for reference use only.
5. If  $\overline{BE}_n$  was HIGH, then the appropriate Byte of DATAout for  $Q_n + 2$  would be disabled (High-Impedance state).

### Timing Waveform of a Multi-Device Pipelined Read<sup>(1,2)</sup>

**NOTES:**

1. B1 Represents Device #1; B2 Represents Device #2. Each Device consists of one IDT70V3569 for this waveform, and are setup for depth expansion in this example. ADDRESS(B1) = ADDRESS(B2) in this situation.
2.  $\overline{BE}_n$ ,  $\overline{OE}$ , and  $\overline{ADS} = V_{IL}$ ;  $CE_1(B1)$ ,  $CE_1(B2)$ ,  $R/\overline{W}$ ,  $\overline{CNTEN}$ , and  $\overline{CNRST} = V_{IH}$ .

4831 drw 07

### Timing Waveform of Left Port Write to Pipelined Right Port Read<sup>(1,2)</sup>

**NOTES:**

1.  $\overline{CE}_0$ ,  $\overline{BE}_n$ , and  $\overline{ADS} = V_{IL}$ ;  $CE_1$ ,  $\overline{CNTEN}$ , and  $\overline{CNTRST} = V_{IH}$ .
2.  $\overline{OE} = V_{IL}$  for the Right Port, which is being read from.  $\overline{OE} = V_{IH}$  for the Left Port, which is being written to.
3. If  $t_{CO} \leq$  minimum specified, then data from right port read is not valid until following right port clock cycle (ie, time from write to valid read on opposite port will be  $t_{CO} + 2 t_{CYC2} + t_{CD2}$ ). If  $t_{CO} >$  minimum, then data from right port read is available on first right port clock cycle (ie, time from write to valid read on opposite port will be  $t_{CO} + t_{CYC} + t_{CD2}$ ).

### Timing Waveform of Pipelined Read-to-Write-to-Read ( $\overline{OE} = V_{IL}$ )<sup>(2)</sup>

**NOTES:**

1. Output state (High, Low, or High-impedance) is determined by the previous cycle control signals.
2.  $\overline{CE}_0$ ,  $\overline{BE}_n$ , and  $\overline{ADS} = V_{IL}$ ;  $CE_1$ ,  $\overline{CNTEN}$ , and  $\overline{CNTRST} = V_{IH}$ . "NOP" is "No Operation".
3. Addresses do not have to be accessed sequentially since  $\overline{ADS} = V_{IL}$  constantly loads the address on the rising edge of the CLK; numbers are for reference use only.
4. "NOP" is "No Operation." Data in memory at the selected address may be corrupted and should be re-written to guarantee data integrity.

### Timing Waveform of Pipelined Read-to-Write-to-Read ( $\overline{OE}$ Controlled)<sup>(2)</sup>

**NOTES:**

1. Output state (High, Low, or High-impedance) is determined by the previous cycle control signals.
2.  $\overline{CE}_0$ ,  $\overline{BE}_n$ , and  $\overline{ADS} = V_{IL}$ ;  $\overline{CE}_1$ ,  $\overline{CNTEN}$ , and  $\overline{CNTRST} = V_{IH}$ .
3. Addresses do not have to be accessed sequentially since  $\overline{ADS} = V_{IL}$  constantly loads the address on the rising edge of the CLK; numbers are for reference use only.
4. This timing does not meet requirements for fastest speed grade. This waveform indicates how logically it could be done if timing so allows.

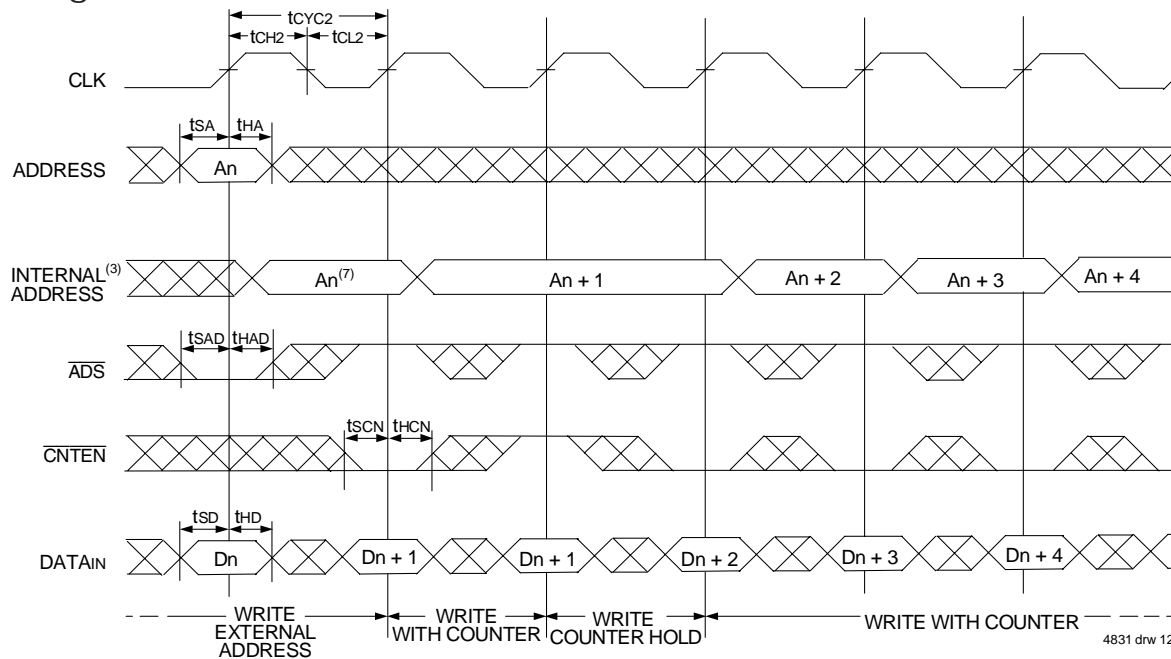

### Timing Waveform of Pipelined Read with Address Counter Advance<sup>(1)</sup>

**NOTES:**

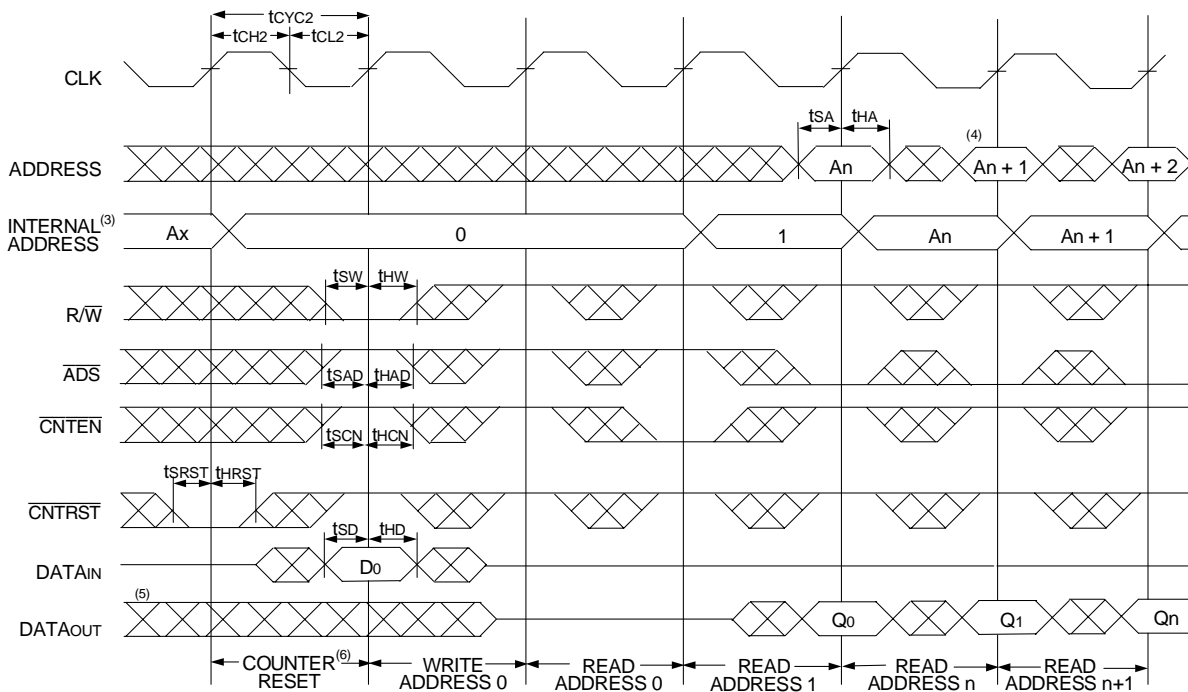

1.  $\overline{CE}_0$ ,  $\overline{OE}$ ,  $\overline{BE}_n = V_{IL}$ ;  $\overline{CE}_1$ ,  $\overline{R/W}$ , and  $\overline{CNTRST} = V_{IH}$ .
2. If there is no address change via  $\overline{ADS} = V_{IL}$  (loading a new address) or  $\overline{CNTEN} = V_{IL}$  (advancing the address), i.e.  $\overline{ADS} = V_{IH}$  and  $\overline{CNTEN} = V_{IH}$ , then the data output remains constant for subsequent clocks.

### Timing Waveform of Write with Address Counter Advance<sup>(1)</sup>

4831 drw 12

### Timing Waveform of Counter Reset<sup>(2)</sup>

4831 drw 13

**NOTES:**

1.  $\overline{CE}_0$ ,  $\overline{BE}_n$ , and  $R/\overline{W} = V_{IL}$ ;  $CE_1$  and  $\overline{CNTRST} = V_{IH}$ .
2.  $\overline{CE}_0$ ,  $\overline{BE}_n = V_{IL}$ ;  $CE_1 = V_{IH}$ .
3. The "Internal Address" is equal to the "External Address" when  $\overline{ADS} = V_{IL}$  and equals the counter output when  $\overline{ADS} = V_{IH}$ .
4. Addresses do not have to be accessed sequentially since  $\overline{ADS} = V_{IL}$  constantly loads the address on the rising edge of the CLK; numbers are for reference use only.
5. Output state (High, Low, or High-impedance) is determined by the previous cycle control signals.
6. No dead cycle exists during counter reset. A READ or WRITE cycle may be coincidental with the counter reset cycle: Addr 0 will be accessed. Extra cycles are shown here simply for clarification.
7.  $\overline{CNTEN} = V_{IL}$  advances Internal Address from 'An' to 'An + 1'. The transition shown indicates the time required for the counter to advance. The 'An + 1' Address is written to during this cycle.

## Functional Description

The IDT70V3569 provides a true synchronous Dual-Port Static RAM interface. Registered inputs provide minimal set-up and hold times on address, data, and all critical control inputs. All internal registers are clocked on the rising edge of the clock signal, however, the self-timed internal write pulse is independent of the LOW to HIGH transition of the clock signal.

An asynchronous output enable is provided to ease asynchronous bus interfacing. Counter enable inputs are also provided to stall the operation of the address counters for fast interleaved memory applications.

A HIGH on  $\overline{CE_0}$  or a LOW on  $CE_1$  for one clock cycle will power down the internal circuitry to reduce static power consumption. Multiple chip enables allow easier banking of multiple IDT70V3569s for depth expansion configurations. Two cycles are required with  $\overline{CE_0}$  LOW and  $CE_1$  HIGH to re-activate the outputs.

## Depth and Width Expansion

The IDT70V3569 features dual chip enables (refer to Truth Table I) in order to facilitate rapid and simple depth expansion with no requirements for external logic. Figure 4 illustrates how to control the various chip enables in order to expand two devices in depth.

The IDT70V3569 can also be used in applications requiring expanded width, as indicated in Figure 4. Through combining the control signals, the devices can be grouped as necessary to accommodate applications needing 72-bits or wider.
