MR2A08A

## Features

- Fast 35 ns Read/Write Cycle
- SRAM Compatible Timing and Pin-out Uses Existing SRAM

Controllers Without Redesign

- Unlimited Read \& Write Endurance
- Data Always Non-volatile for >20-years at Temperature
- One Memory Replaces Flash, SRAM, EEPROM and BBRAM in System for Simpler, More Efficient Design

- Replace battery-backed SRAM solutions with MRAM to eliminate battery assembly, reliability, and liability issues
- 3.3 Volt Power Supply
- Automatic Data Protection on Power Loss
- Commercial, Industrial, Automotive Temperatures
- RoHS-Compliant SRAM-compatible TSOPII Package
- RoHS-Compliant SRAM-compatible BGA Package Shrinks Board Area By Three Times

48-BGA

## $\checkmark$ RoHS

## Introduction

The MR2A08A is a 4,194,304-bit magnetoresistive random access memory (MRAM) device organized as 524, 288 words of 8 bits. The MR2A08A offers SRAM compatible 35 ns read/write timing with unlimited endurance. Data is always non-volatile for greater than 20 -years. Data is automatically protected on power loss by low-voltage inhibit circuitry to prevent writes with voltage out of specification. The MR2A08A is the ideal memory solution for applications that must permanently store and retrieve critical data and programs quickly.

The MR2A08A is available in small footprint 400-mil, 44-lead plastic small-outline TSOP type-II package or $8 \mathrm{~mm} \times 8 \mathrm{~mm}$, 48-pin ball grid array (BGA) package with 0.75 mm ball centers. These packages are compatible with similar low-power SRAM products and other non-volatile RAM products.

The MR2A08A provides highly reliable data storage over a wide range of temperatures. The product is offered with commercial temperature ( 0 to +70 degree ${ }^{\circ} \mathrm{C}$ ), industrial temperature ( -40 to $+85^{\circ} \mathrm{C}$ ), and automotive temperature ( -40 to +125 degree ${ }^{\circ} \mathrm{C}$ ) range options.

## Electrical Specifications

## Absolute Maximum Ratings

This device contains circuitry to protect the inputs against damage caused by high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage greater than maximum rated voltages to these high-impedance (Hi-Z) circuits.

The device also contains protection against external magnetic fields. Precautions should be taken to avoid application of any magnetic field more intense than the maximum field intensity specified in the maximum ratings.

| Absolute Maximum Ratings ${ }^{1}$ |  |  |  |
| :---: | :---: | :---: | :---: |
| Parameter | Symbol | Value | Unit |
| Supply voltage ${ }^{2}$ | $V_{\text {DD }}$ | -0.5 to 4.0 | V |
| Voltage on any $\mathrm{pin}^{2}$ | $\mathrm{V}_{\text {In }}$ | -0.5 to $\mathrm{V}_{\mathrm{DD}}+0.5$ | V |
| Output current per pin | $\mathrm{I}_{\text {Out }}$ | $\pm 20$ | mA |
| Package power dissipation ${ }^{3}$ | $\mathrm{P}_{\mathrm{D}}$ | 0.600 | W |
| Temperature under bias  <br> MR2A08A (Commercial) <br> MR2A08AC (Industrial) <br> MR2A08AM (Automotive) | $\mathrm{T}_{\text {Bias }}$ | $\begin{aligned} & -10 \text { to } 85 \\ & -45 \text { to } 95 \\ & -45 \text { to } 130 \end{aligned}$ | ${ }^{\circ} \mathrm{C}$ |
| Storage temperature | $\mathrm{T}_{\text {stg }}$ | -55 to 150 | ${ }^{\circ} \mathrm{C}$ |
| Lead temperature during solder (3 minute max) | T Lead | 260 | ${ }^{\circ} \mathrm{C}$ |
| Maximum magnetic field during write MR2A08A (All Temperature) | $\mathrm{H}_{\text {max_write }}$ | 2000 | A/m |
| Maximum magnetic field during read or standby | $\mathrm{H}_{\text {max_read }}$ | 8000 | A/m |
| NOTES: |  |  |  |
| 1 Permanent device damage may occur if absolute maximum ratings are exceeded. Functional operation should be restricted to recommended operating conditions. Exposure to excessive voltages or magnetic fields could affect device reliability. |  |  |  |

Table 4. Operating Conditions

| Parameter | Symbol | Min | Typ | Max | Unit |
| :--- | :---: | :---: | :---: | :---: | :---: |

NOTES:
1 There is a 2 ms startup time once Vdd exceeds Vddmin. See Power up and Powerdown Sequencing section below
$2 \mathrm{~V}_{\mathrm{IH}}(\max )=\mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{Vdc} ; \mathrm{V}_{\mathrm{IH}}(\max )=\mathrm{V}_{\mathrm{DD}}+2.0 \mathrm{Vac}$ (pulse width $\leq 10 \mathrm{~ns}$ ) for $\mathrm{I} \leq 20.0 \mathrm{~mA}$.
$3 \mathrm{~V}_{\mathrm{IL}}(\mathrm{min})=-0.5 \mathrm{Vdc} ; \mathrm{V}_{\mathrm{IL}}(\mathrm{min})=-2.0 \mathrm{Vac}($ pulse width $\leq 10 \mathrm{~ns})$ for $\mathrm{I} \leq 20.0 \mathrm{~mA}$.
4 Automotive temperature profile assumes $10 \%$ Duty Cycle at Maximum Temperature (2-years out of 20-year Life)

## Power Up and Power Down Sequencing

MRAM is protected from write operations whenever $V_{D D}$ is less than $V_{w I}$. As soon as $V_{D D}$ exceeds $V_{D D \min }$, there is a startup time of 2 ms before read or write operations can start. This time allows memory power supplies to stabilize. The /E and /W control signals should track $V_{D D}$ on power up to $V_{D D}-0.2 \mathrm{v}$ or $\mathrm{V}_{\mathrm{IH}}$ (whichever is lower) and remain high for the startup time. In most systems, this means that these signals should be pulled up with a resistor so that signal remains high if the driving signal is Hi-Z during power up. Any logic that drives / E and /W should hold the signals high with a power-on reset signal for longer than the startup time. During power loss or brownout where $\mathrm{V}_{\text {DD }}$ goes below $\mathrm{V}_{\text {wI }}$, writes are protected and a startup time must be observed when power returns above $V_{\text {DDmin }}$.
dc Characteristics

## NOTES:

$1 \overline{\mathrm{~W}}$ is high for read cycle.
2 Power supplies must be properly grounded and decoupled, and bus contention conditions must be minimized or eliminated during read or write cycles.

3 Addresses valid before or at the same time $\overline{\mathrm{E}}$ goes low.
4 This parameter is sampled and not $100 \%$ tested.
5 Transition is measured $\pm 200 \mathrm{mV}$ from steady-state voltage.

NOTES:
Device is continuously selected ( $\overline{\mathrm{E}} \leq \mathrm{V}_{\mathrm{IL}}, \overline{\mathrm{G}} \leq \mathrm{V}_{\mathrm{IL}}$ ).
Figure 5. Read Cycle 1

## Timing Specifications

## Write Mode

Table 10. Write Cycle Timing 1 ( $\overline{\mathrm{W}}$ Controlled) ${ }^{1,2,3,4,5}$

| Parameter | Symbol | Min | Max | Unit |
| :---: | :---: | :---: | :---: | :---: |
| Write cycle time ${ }^{6}$ | $\mathrm{t}_{\text {AVAV }}$ | 35 | - | ns |
| Address set-up time | $\mathrm{t}_{\text {AVWL }}$ | 0 | - | ns |
| Address valid to end of write ('G high) | $\mathrm{t}_{\text {AVWH }}$ | 18 | - | ns |
| Address valid to end of write ( $\overline{\mathrm{G}}$ low) | $\mathrm{t}_{\text {AVWH }}$ | 20 | - | ns |
| Write pulse width ( $\overline{\mathrm{G}}$ high) | $t_{\text {WLWH }}$ <br> $t_{\text {WLEH }}$ | 15 | - | ns |
| Write pulse width ( $\overline{\mathrm{G}}$ low) | ${ }^{t}$ WLWH <br> $t_{\text {WLEH }}$ | 15 | - | ns |
| Data valid to end of write | $t_{\text {DVWH }}$ | 10 | - | ns |
| Data hold time | ${ }^{\text {W WHDX }}$ | 0 | - | ns |
| Write low to data Hi-Z ${ }^{\text {7, 8, }}$ | $t_{\text {WLQZ }}$ | 0 | 12 | ns |
| Write high to output active ${ }^{7,8,9}$ | $t_{\text {WHQX }}$ | 3 | - | ns |
| Write recovery time | $\mathrm{t}_{\text {WHAX }}$ | 12 | - | ns |

## NOTES:

1 A write occurs during the overlap of $\bar{E}$ low and $\bar{W}$ low.
2 Power supplies must be properly grounded and decoupled, and bus contention conditions must be minimized or eliminated during read and write cycles
3 If $\bar{G}$ goes low at the same time or after $\bar{W}$ goes low, the output will remain in a high-impedance state.
4 After $\bar{W}, \bar{E}$, or $\overline{U B} / \overline{L B}$ has been brought high, the signal must remain in steady-state high for a minimum of 2 ns .
5 The minimum time between $\bar{E}$ being asserted low in one cycle to $\overline{\mathrm{E}}$ being asserted low in a subsequent cycle is the same as the minimum cycle time allowed for the device.
6 All write cycle timings are referenced from the last valid address to the first transition address.
7 This parameter is sampled and not $100 \%$ tested.
8 Transition is measured $\pm 200 \mathrm{mV}$ from steady-state voltage.
9 At any given voltage or temperature, $\mathrm{t}_{\text {WLQZ }} \max <\mathrm{t}_{\text {WHOX }} \min$.
