NM27C040
4,194,304-Bit (512K x 8) High Performance CMOS EPROM

General Description

The NM27C040 is a high performance, 4,194,304-bit Electrically Programmable UV Erasable Read Only Memory. It is organized as 512K words of 8 bits each. Its pin-compatibility with byte-wide JEDEC EPROMs enables upgrades through 8 Mbit EPROMs. The "Don't Care" feature on V_{PP} during read operations allows memory expansions from 1M to 8 Mbits with no printed circuit board changes.
The NM27C040 provides microprocessor-based systems extensive storage capacity for large portions of operating system and application software. Its 120 ns access time provides high speed operation with high-performance CPUs. The NM27C040 offers a single chip solution for the code storage requirements of 100% firmware-based equipment. Frequently used software routines are quickly executed from EPROM storage, greatly enhancing system utility.

The NM27C040 is manufactured using Fairchild's advanced CMOS AMG™ EPROM technology.

Features

- High performance CMOS
  — 120 ns access time
- Simplified upgrade path
  — V_{PP} is a "Don't Care" during normal read operation
- Manufacturer's identification code
- JEDEC standard pin configuration
  — 32-pin DIP
 — 32-pin PLCC
  — 32-pin TSOP

AC Waveforms (Notes 6, 7, 9)

DS010836-4

Note 1: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 2: This parameter is only sampled and is not 100% tested.

Note 3: $\overline{OE}$ may be delayed up to $t_{ACC} - t_{OE}$ after the falling edge of $\overline{CE}$ without impacting t_{ACC}.

Note 4: The t_{DF} and t_{CF} compare level is determined as follows:

High to TRI-STATE®, the measured V_{OH1} (DC) – 0.10V;

Low to TRI-STATE, the measured V_{OL1} (DC) + 0.10V.

Note 5: TRI-STATE may be attained using $\overline{OE}$ or $\overline{CE}$.

Note 6: The power switching characteristics of EPROMs require careful device decoupling. It is recommended that at least a 0.1 µF ceramic capacitor be used on every device between V_{CC} and GND.

Note 7: The outputs must be restricted to V_{CC} + 1.0V to avoid latch-up and device damage.

Note 8: 1 TTL Gate: I_{OL} = 1.6 mA, I_{OH} = –400 µA.

C_L: 100 pF includes fixture capacitance.

Note 9: V_{PP} may be connected to V_{CC} except during programming.

Note 10: Inputs and outputs can undershoot to –2.0V for 20 ns Max.

Programming Waveform (Note 13)

V_{IH}	Input High Voltage		2.4	4.0		V
t_{IN}	Input Timing Reference Voltage		0.8		2.0	V
t_{OUT}	Output Timing Reference Voltage		0.8		2.0	V

Note 11: Fairchild's standard product warranty applies only to devices programmed to specifications described herein.

Note 12: V_{CC} must be applied simultaneously or before V_{PP} and removed simultaneously or after V_{PP}. The EPROM must not be inserted into or removed from a board with voltage applied to V_{PP} or V_{CC}.

Note 13: The maximum absolute allowable voltage which may be applied to the V_{PP} pin during programming is 14V. Care must be taken when switching the V_{PP} supply to prevent any overshoot from exceeding this 14V maximum specification. At least a 0.1 µF capacitor is required across V_{PP}, V_{CC} to GND to suppress spurious voltage transients which may damage the device.

Note 14: During power up the $\overline{CE}/\overline{PGM}$ pin must be brought high (≥V_{IH}) either coincident with or before power is applied to V_{PP}.

FIGURE 1.

Functional Description

DEVICE OPERATION

The six modes of operation of the EPROM are listed in *Table 1*. It should be noted that all inputs for the six modes are at TTL levels. The power supplies required are V_{CC} and V_{PP}. The V_{PP} power supply must be at 12.75V during the three programming modes, and must be at 5V in the other three modes. The V_{CC} power supply must be at 6.25V during the three programming modes, and at 5V in the other three modes.

Read Mode

The EPROM has two control functions, both of which must be logically active in order to obtain data at the outputs. Chip Enable ($\overline{CE}$ /PGM) is the power control and should be used for device selection. Output Enable (OE) is the output control and should be used to gate data to the output pins, independent of device selection. Assuming that addresses are stable, address access time (t_{ACC}) is equal to the delay from CE to output (t_{CE}). Data is available at the outputs t_{OE} after the falling edge of OE, assuming that $\overline{CE}$ /PGM has been low and addresses have been stable for at least t_{ACC}-t_{OE}.

Standby Mode

The EPROM has a standby mode which reduces the active power dissipation by over 99%, from of 65 mW to 0.55 mW. The EPROM is placed in the standby mode by applying a

Functional Description (Continued)

CMOS high signal to the $\overline{CE}/\overline{PGM}$ input. When in standby mode, the outputs are in a high impedance state, independent of the OE input.

Output Disable

The EPROM is placed in output disable by applying a TTL high signal to the OE input. When in output disable all circuitry is enabled, except the outputs are in a high impedance state (TRI-STATE).

Output OR-Tying

Because the EPROM is usually used in larger memory arrays, Fairchild has provided a 2-line control function that accommodates this use of multiple memory connections. The 2-line control function allows for:

1. the lowest possible memory power dissipation, and

2. complete assurance that output bus contention will not occur.

To most efficiently use these two control lines, it is recommended that $\overline{CE}/\overline{PGM}$ be decoded and used as the primary device selecting function, while OE be made a common connection to all devices in the array and connected to the READ line from the system control bus. This assures that all deselected memory devices are in their low power standby modes and that the output pins are active only when data is desired from a particular memory device.

Programming

CAUTION: Exceeding 14V on pin 1 (V_{PP}) will damage the EPROM.

Initially, and after each erasure, all bits of the EPROM are in the "1's" state. Data is introduced by selectively programming "0's" into the desired bit locations. Although only "0's" will be programmed, both "1's" and "0's" can be presented in the data word. The only way to change a "0" to a "1" is by ultraviolet light erasure.

The EPROM is in the programming mode when the V_{PP}-power supply is at 12.75V and OE is at V_{IH}. It is required that at least a 0.1 µF capacitor be placed across V_{PP}, V_{CC} to ground to suppress spurious voltage transients which may damage the device. The data to be programmed is applied 8 bits in parallel to the data output pins. The levels required for the address and data inputs are TTL.

When the address and data are stable, an active low, TTL program pulse is applied to the $\overline{CE}/\overline{PGM}$ input. A program pulse must be applied at each address location to be programmed. The EPROM is programmed with the Turbo Programming Algorithm shown in *Figure 1*. Each Address is programmed with a series of 50 µs pulses until it verifies good, up to a maximum of 10 pulses. Most memory cells will program with a single 50 µs pulse. (The standard National Semiconductor Algorithm may also be used but it will have longer programming time.)

The EPROM must not be programmed with a DC signal applied to the $\overline{CE}/\overline{PGM}$ input.

Programming multiple EPROM in parallel with the same data can be easily accomplished due to the simplicity of the programming requirements. Like inputs of the parallel EPROM may be connected together when they are programmed with the same data. A low level TTL pulse applied to the $\overline{CE}/\overline{PGM}$ input programs the paralleled EPROM.

Program Inhibit

Programming multiple EPROMs in parallel with different data is also easily accomplished. Except for CE/PGM all like inputs (including OE) of the parallel EPROMs may be common. A TTL low level program pulse applied to an EPROM's $\overline{CE}/\overline{PGM}$ input with V_{PP} at 12.75V will program that EPROM. A TTL high level $\overline{CE}/\overline{PGM}$ input inhibits the other EPROMs from being programmed.

Program Verify

A verify should be performed on the programmed bits to determine whether they were correctly programmed. The verify may be performed with V_{PP} at 12.75V. V_{PP} must be at V_{CC}, except during programming and program verify.

AFTER PROGRAMMING

Opaque labels should be placed over the EPROM window to prevent unintentional erasure. Covering the window will also prevent temporary functional failure due to the generation of photo currents.

MANUFACTURER'S IDENTIFICATION CODE

The EPROM has a manufacturer's identification code to aid in programming. When the device is inserted in an EPROM programmer socket, the programmer reads the code and then automatically calls up the specific programming algorithm for the part. This automatic programming control is only possible with programmers which have the capability of reading the code.

The Manufacturer's Identification code, shown in *Table 2*, specifically identifies the manufacturer and device type. The code for NM27C040 is "8F08", where "8F" designates that it is made by Fairchild Semiconductor, and "08" designates a 4 Megabit (512K x 8) part.

The code is accessed by applying 12V ±0.5V to address pin A9. Addresses A1–A8, A10–A18, and all control pins are held at V_{IL}. Address pin A0 is held at V_{IL} for the manufacturer's code, and held at V_{IH} for the device code. The code is read on the eight data pins, O_0–O_7. Proper code access is only guaranteed at 25˚C ±5˚C.

ERASURE CHARACTERISTICS

The erasure characteristics of the device are such that erasure begins to occur when exposed to light with wavelengths shorter than approximately 4000 Angstroms (Å). It should be noted that sunlight and certain types of fluorescent lamps have wavelengths in the 3000Å–4000Å range.

The recommended erasure procedure for the EPROM is exposure to short wave ultraviolet light which has a wavelength of 2537Å. The integrated dose (i.e., UV intensity X exposure time) for erasure should be minimum of 15W-sec/cm^2.

The EPROM should be placed within 1 inch of the lamp tubes during erasure. Some lamps have a filter on their tubes which should be removed before erasure.

An erasure system should be calibrated periodically. The distance from lamp to device should be maintained at one inch. The erasure time increase as the square of the distance from the lamp. (If distance is doubled the erasure time increases by factor of 4.) Lamps lose intensity as they age. When a lamp is changed, the distance has changed, or the lamp has aged, the system should be checked to make certain full erasure is occurring. Incomplete erasure will cause symptoms that can be misleading. Programmers, components, and even system designs have been erroneously suspected when incomplete erasure was the problem.

7

Functional Description (Continued)

SYSTEM CONSIDERATION

The power switching characteristics of EPROMs require careful decoupling of the devices. The supply current, I_{CC}, has three segments that are of interest to the system designer: the standby current level, the active current level, and the transient current peaks that are produced by voltage transitions on input pins. The magnitude of these transient current peaks is dependent of the output capacitance loading of the device. The associated V_{CC} transient voltage peaks can be suppressed by properly selected decoupling capacitors. It is recommended that at least a 0.1 µF ceramic capacitor be used on every device between V_{CC} and GND. This should be a high frequency capacitor of low inherent inductance. In addition, at least a 4.7 µF bulk electrolytic capacitor should be used between V_{CC} and GND for each eight devices. The bulk capacitor should be located near where the power supply is connected to the array. The purpose of the bulk capacitor is to overcome the voltage drop caused by the inductive effects of the PC board traces.

Mode Selection

The modes of operation of the NM27C040 are listed in *Table 1*. A single 5V power supply is required in the read mode. All inputs are TTL levels except for V_{PP} and A9 for device signature.

TABLE 1. Modes Selection

Pins Mode	$\overline{CE}$ /PGM	$\overline{OE}$	V_{PP}	V_{CC}	Outputs
Read	V_{IL}	V_{IL}	X (Note 15)	5.0V	D_{OUT}

LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DE-
VICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMI-
CONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or sys-
tems which, (a) are intended for surgical implant into
the body, or (b) support or sustain life, and (c) whose
failure to perform when properly used in accordance
with instructions for use provided in the labeling, can
be reasonably expected to result in a significant injury
to the user.

2. A critical component in any component of a life support
device or system whose failure to perform can be rea-
sonably expected to cause the failure of the life support
device or system, or to affect its safety or effectiveness.
