

# DS5001FP 128k Soft Microprocessor Chip

#### www.maxim-ic.com

#### **FEATURES**

#### 8051-Compatible Microprocessor Adapts to Its Task

- Accesses up to 128kB of nonvolatile SRAM
- In-system programming through on-chip serial port
- Can modify its own program or data memory
- Accesses memory on a separate byte-wide bus
- Performs CRC-16 check of NV RAM memory
- Decodes memory and peripheral chip enables

#### High-Reliability Operation

- Maintains all nonvolatile resources for over 10 years
- Power-fail reset
- Early warning power-fail interrupt
- Watchdog timer
- Lithium backs user SRAM for program/data storage
- Precision bandgap reference for power monitor

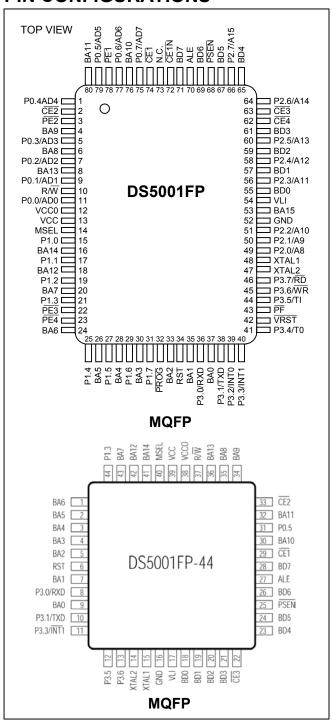

#### Fully 8051 Compatible

- 128kB scratchpad RAM
- Two timer/counters
- On-chip serial port
- 32 parallel I/O port pins

#### Software Security Available with DS5002FP Secure Microprocessor

This data sheet must be used in conjunction with the Secure Microcontroller User's Guide, available on our website at <a href="https://www.maxim-ic.com/microcontrollers">www.maxim-ic.com/microcontrollers</a>. The user's guide contains operating information, whereas the data sheet contains ordering information, pinout, and electrical specifications

#### PIN CONFIGURATIONS

**Note:** Some revisions of this device may incorporate deviations from published specifications known as errata. Multiple revisions of any device may be simultaneously available through various sales channels. For information about device errata, click here: <a href="www.maxim-ic.com/errata">www.maxim-ic.com/errata</a>.

1 of 27 REV: 070605

#### ORDERING INFORMATION

PART	TEMP RANGE	MAX CLOCK	PIN-
TANI	IEMIT KANGE	SPEED (MHz)	PACKAGE
DS5001FP-16	$0^{\circ}$ C to $+70^{\circ}$ C	16	80 MQFP
DS5001FP-16+	0°C to +70°C	16	80 MQFP
DS5001FP-16N	-40°C to +85°C	16	80 MQFP
DS5001FP-16N+	-40°C to +85°C	16	80 MQFP
DS5001FP-12-44	0°C to +70°C	12	44MQFP
DS5001FP-12-44+	0°C to +70°C	12	44 MQFP

<sup>+</sup> Denotes a Pb-free/RoHS-compliant device.

#### DESCRIPTION

The DS5001FP 128k soft microprocessor chip is an 8051-compatible microprocessor based on NV RAM technology and designed for systems that need large quantities of nonvolatile memory. It provides full compatibility with the 8051 instruction set, timers, serial port, and parallel I/O ports. By using NV RAM instead of ROM, the user can program and then reprogram the microprocessor while in-system. The application software can even change its own operation, which allows frequent software upgrades, adaptive programs, customized systems, etc. In addition, by using NV SRAM, the DS5001FP is ideal for data logging applications. It also connects easily to a Dallas real-time clock.

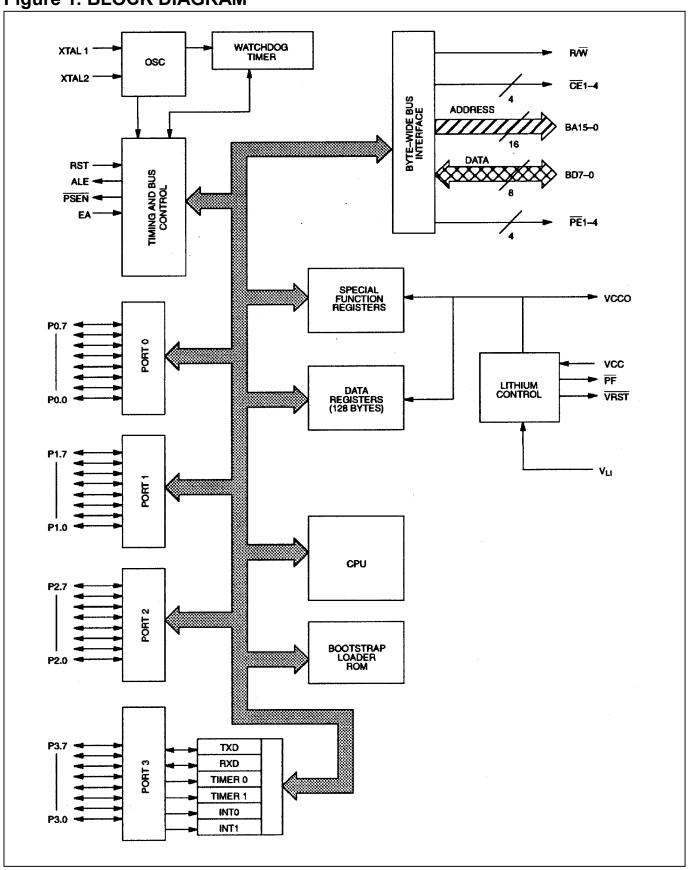

The DS5001FP provides the benefits of NV RAM without using I/O resources. It uses a nonmultiplexed byte-wide address and data bus for memory access. This bus performs all memory access and provides decoded chip enables for SRAM, which leaves the 32 I/O port pins free for application use. The DS5001FP uses ordinary SRAM and battery-backs the memory contents for over 10 years at room temperature with a small external battery. A DS5001FP also provides high-reliability operation in harsh environments. These features include the ability to save the operating state, power-fail reset, power-fail interrupt, and watchdog timer.

A user programs the DS5001FP through its on-chip serial bootstrap loader. The bootstrap loader supervises the loading of software into NV RAM, validates it, and then becomes transparent to the user. Software can be stored in multiple 32kB or one 128kB CMOS SRAM(s). Using its internal partitioning, the DS5001FP can divide a common RAM into user-selectable program and data segments. This partition can be selected at program loading time, but can then be modified later at any time. The microprocessor decodes memory access to the SRAM and addresses memory through its byte-wide bus. Memory portions designated code or ROM are automatically write-protected by the microprocessor. Combining program and data storage in one device saves board space and cost.

The DS5001FP offers several bank switches for access to even more memory. In addition to the primary data area of 64kB, a peripheral selector creates a second 64kB data space with four accompanying chip enables. This area can be used for memory-mapped peripherals or more data storage. The DS5001FP can also use its expanded bus on ports 0 and 2 (like an 8051) to access an additional 64kB of data space. Lastly, the DS5001FP provides one additional bank switch that changes up to 60kB of the NV RAM program space into data memory. Thus, with a small amount of logic, the DS5001 accesses up to 252kB of data memory.

The DS2251T is available (Refer to the data sheet at <a href="www.maxim-ic.com/microcontrollers">www.maxim-ic.com/microcontrollers</a>.) for users who want a preconstructed module using the DS5001FP, RAM, lithium cell, and a real-time clock. For more details, refer to the *Secure Microcontroller User's Guide*. For users desiring software security, the DS5002FP is functionally identical to the DS5001FP but provides superior firmware security. The 44-pin version of the device is functionally identical to the 80-pin version but sports a reduced pin count and footprint.

**PIN DESCRIPTION (continued)** 

	PIN PIN NAME PINCEPON				
		NAME	FUNCTION		
80 PIN	44 PIN				
53, 16, 8, 18, 80, 76, 4, 6, 20, 24, 26, 28, 30, 33, 35, 37	41, 36, 42, 32, 30, 34, 35, 43, 1, 2, 3, 4, 5, 7, 9	BA14– BA0	Byte-Wide Address Bus Bits 14–0. This bus is combined with the nonmultiplexed data bus (BD7–0) to access NV SRAM. Decoding is performed using $\overline{\text{CE1}}$ through $\overline{\text{CE4}}$ . Therefore, BA15 is not actually needed. Read/write access is controlled by R/ $\overline{\text{w}}$ . BA14–0 connect directly to an 8k, 32k, or 128k SRAM. If an 8k RAM is used, BA13 and BA14 are unconnected. If a 128k SRAM is used, the micro converts $\overline{\text{CE2}}$ and $\overline{\text{CE3}}$ to serve as A16 and A15 respectively.		
71, 69, 67, 65,	28, 26, 24, 23,	BD7-0	Byte-Wide Data Bus Bits 7–0. This 8-bit, bidirectional bus is combined with the nonmultiplexed address bus (BA14–0) to access NV SRAM. Decoding is performed		
61, 59, 57, 55	21, 20, 19, 18	BD/-0	on $\overline{\text{CE1}}$ and $\overline{\text{CE2}}$ . Read/write access is controlled by R/ $\overline{\text{W}}$ . BD7–0 connect directly to an SRAM, and optionally to a real-time clock or other peripheral.		
10	37	R/ w	<b>Read/Write.</b> This signal provides the write enable to the SRAMs on the byte-wide bus. It is controlled by the memory map and partition. The blocks selected as program (ROM) are write-protected.		
74	29	CE1	<b>Chip Enable 1.</b> This is the primary decoded chip enable for memory access on the byte-wide bus. It connects to the chip enable input of one SRAM. $\overline{\text{CEI}}$ is lithium-backed. It remains in a logic high inactive state when $V_{CC}$ falls below $V_{LI}$ .		
72	_	CE1N	<b>Non-Battery-Backed Version of Chip Enable 1.</b> This can be used with a 32kB EPROM. It should not be used with a battery-backed chip.		
2	33	CE2	Chip Enable 2. This chip enable is provided to access a second 32k block of memory. It connects to the chip enable input of one SRAM. When MSEL = 0, the micro converts $\overline{\text{CE2}}$ into A16 for a 128k x 8 SRAM. $\overline{\text{CE2}}$ is lithium-backed and remains at a logic high when $V_{CC}$ falls below $V_{LI}$ .		
63	22	CE3	Chip Enable 3. This chip enable is provided to access a third 32k block of memory. It connects to the chip enable input of one SRAM. When MSEL = 0, the micro converts $\overline{\text{CE3}}$ into A15 for a 128k x 8 SRAM. $\overline{\text{CE3}}$ is lithium-backed and remains at a logic high when $V_{CC}$ falls below $V_{LI}$ .		
62	_	CE4	<b>Chip Enable 4.</b> This chip enable is provided to access a fourth 32k block of memory. It connects to the chip-enable input of one SRAM. When MSEL = 0, this signal is unused. $\overline{CE4}$ is lithium-backed and remains at a logic high when $V_{CC} < V_{LI}$ .		
78	_	PE1	Peripheral Enable 1. Accesses data memory between addresses 0000h and 3FFFh when the PES bit is set to a logic 1. Commonly used to chip enable a byte-wide real-time clock such as the DS1283. $\overline{\text{PEI}}$ is lithium-backed and remains at a logic high when $V_{CC}$ falls below $V_{LI}$ . Connect $\overline{\text{PEI}}$ to battery-backed functions only.		
3	_	PE2	Peripheral Enable 2. Accesses data memory between addresses 4000h and 7FFFh when the PES bit is set to a logic 1. $\overline{PE2}$ is lithium-backed and remains at a logic high when $V_{CC}$ falls below $V_{LI}$ . Connect $\overline{PE2}$ to battery-backed functions only.		
22	_	PE3	<b>Peripheral Enable 3.</b> Accesses data memory between addresses 8000h and BFFFh when the PES bit is set to a logic 1. $\overline{\text{PE3}}$ is not lithium-backed and can be connected to any type of peripheral function. If connected to a battery-backed chip, it needs additional circuitry to maintain the chip enable in an inactive state when $V_{CC} < V_{LI}$ .		
23	_	PE4	<b>Peripheral Enable 4.</b> Accesses data memory between addresses C000h and FFFFh when the PES bit is set to a logic 1. $\overline{\text{PE4}}$ is not lithium-backed and can be connected to any type of peripheral function. If connected to a battery-backed chip, it needs additional circuitry to maintain the chip enable in an inactive state when $V_{\text{CC}} < V_{\text{LI}}$ .		
32	_	PROG	<b>Invokes the bootstrap loader on a falling edge.</b> This signal should be debounced so that only one edge is detected. If connected to ground, the micro enters bootstrap loading on power-up. This signal is pulled up internally.		

**PIN DESCRIPTION (continued)** 

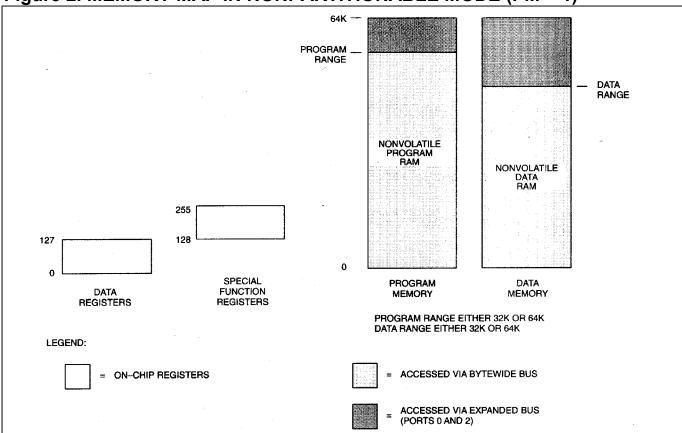

PIN   80 PIN   44 PIN   NAM		NAME	FUNCTION		
		NAME	FUNCTION		
42		VRST	This I/O pin (open drain with internal pullup) indicates that the power supply ( $V_{CC}$ ) has fallen below the $V_{CCmin}$ level and the micro is in a reset state. When this occurs, the DS5001FP drives this pin to a logic 0. Because the micro is lithium-backed, this signal is guaranteed even when $V_{CC} = 0V$ . Because it is an I/O pin, it also forces a reset if pulled low externally. This allows multiple parts to synchronize their power-down resets.		
43	_	PF	This output goes to a logic 0 to indicate that $V_{CC} < V_{LI}$ and the micro has switched to lithium backup. Because the micro is lithium-backed, this signal is guaranteed even when $V_{CC} = 0V$ . The normal application of this signal is to control lithium-powered current to isolate battery-backed functions from non-battery-backed functions.		
14	40	MSEL	<b>Memory Select.</b> This signal controls the memory size selection. When MSEL = +5V, the DS5001FP expects to use 32k x 8 SRAMs. When MSEL = 0V, the DS5001FP expects to use a 128k x 8 SRAM. MSEL must be connected regardless of partition, mode, etc.		
73		N.C.	No Connection		

#### INSTRUCTION SET

The DS5001FP executes an instruction set that is object code-compatible with the industry standard 8051 microcontroller. As a result, software development packages such as assemblers and compilers that have been written for the 8051 are compatible with the DS5001FP. A complete description of the instruction set and operation are provided in the *Secure Microcontroller User's Guide*. Also note that the DS5001FP is embodied in the DS2251T module. The DS2251T combines the DS5001FP with between 32k and 128k of SRAM, a lithium cell, and a real-time clock. This is packaged in a 72-pin SIMM module.

#### MEMORY ORGANIZATION

Figure 2 illustrates the memory map accessed by the DS5001FP. The entire 64k of program and 64k of data are potentially available to the byte-wide bus. This preserves the I/O ports for application use. The user controls the portion of memory that is actually mapped to the byte-wide bus by selecting the program range and data range. Any area not mapped into the NV RAM is reached by the expanded bus on ports 0 and 2. An alternate configuration allows dynamic partitioning of a 64k space as shown in Figure 3. Selecting PES=1 provides another 64k of potential data storage or memory-mapped peripheral space as shown in Figure 4. These selections are made using special function registers. The memory map and its controls are covered in detail in the Secure Microcontroller User's Guide.

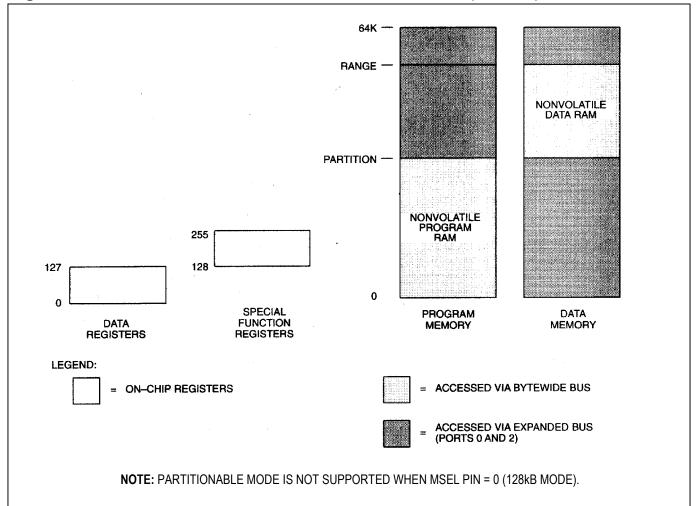

Figure 3. MEMORY MAP IN PARTITIONABLE MODE (PM = 0)

Figure 4. MEMORY MAP WITH PES = 1

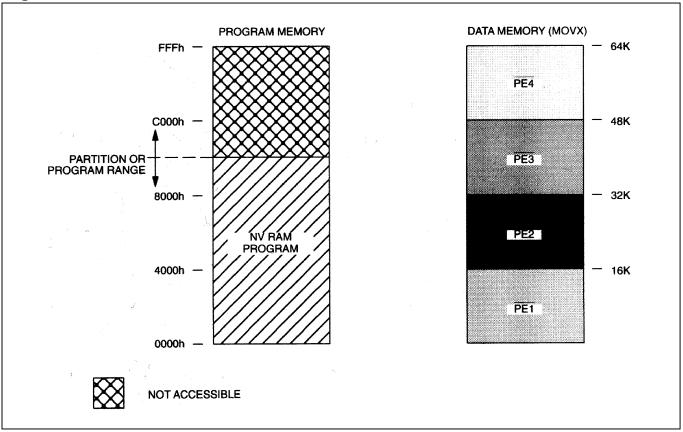

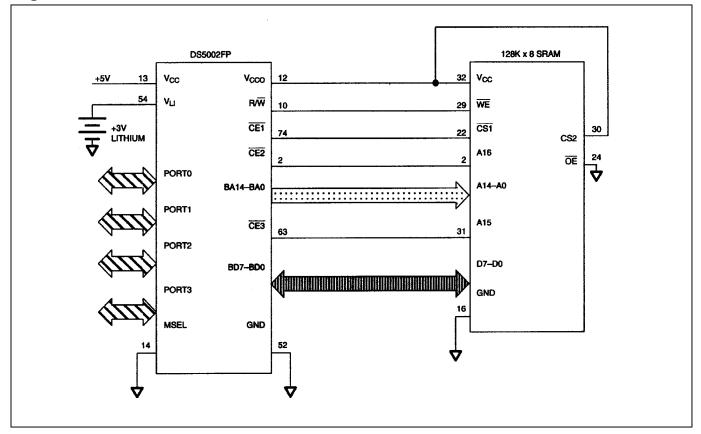

Figure 5 illustrates a typical memory connection for a system using a 128kB SRAM. Note that in this configuration, both program and data are stored in a common RAM chip Figure 6 shows a similar system with using two 32kB SRAMs. The byte-wide address bus connects to the SRAM address lines. The bidirectional byte-wide data bus connects the data I/O lines of the SRAM.

Figure 5. CONNECTION TO 128k x 8 SRAM

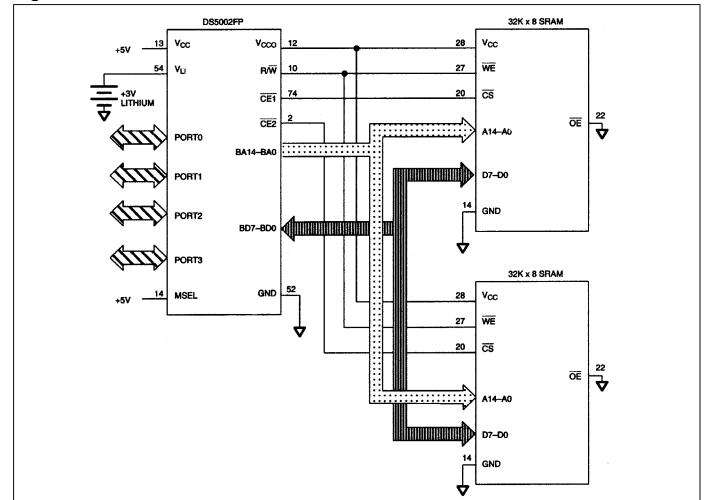

Figure 6. DS5001FP CONNECTION TO 64k x 8 SRAM

#### POWER MANAGEMENT

The DS5001FP monitors  $V_{CC}$  to provide power-fail reset, early warning power-fail interrupt, and switch over to lithium backup. It uses an internal bandgap reference in determining the switch points. These are called  $V_{PFW}$ ,  $V_{CCMIN}$ , and  $V_{LI}$ , respectively. When  $V_{CC}$  drops below  $V_{PFW}$ , the DS5001FP performs an interrupt vector to location 2Bh if the power-fail warning was enabled. Full processor operation continues regardless. When power falls further to  $V_{CCMIN}$ , the DS5001FP invokes a reset state. No further code execution is performed unless power rises back above  $V_{CCMIN}$ . All decoded chip enables and the  $R/\overline{W}$  signal go to an inactive (logic 1) state.  $V_{CC}$  is still the power source at this time. When  $V_{CC}$  drops further to below  $V_{LI}$ , internal circuitry switches to the lithium cell for power. The majority of internal circuits are disabled and the remaining nonvolatile states are retained. Any devices connected  $V_{CCO}$  are powered by the lithium cell at this time.  $V_{CCO}$  is at the lithium battery voltage minus approximately 0.45V. This drop varies depending on the load. Low power SRAMs should be used for this reason. When using the DS5001FP, the user must select the appropriate battery to match the RAM data retention current and the desired backup lifetime. Note that the lithium cell is only loaded when  $V_{CC} < V_{LI}$ . The *User's Guide* has more information on this topic. The trip points  $V_{CCMIN}$  and  $V_{PFW}$  are listed in the *Electrical Specifications* section.

## **ABSOLUTE MAXIMUM RATINGS**

Voltage Range on Any Pin Relative to Ground	0.3V to $(V_{CC} + 0.5V)$
Voltage Range on V <sub>CC</sub> Related to Ground	0.3V to 6.0V
Operating Temperature Range	
Storage Temperature Range (Note 1)	
Soldering Temperature	

This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operation sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability.

Note 1: Storage temperature is defined as the temperature of the device when  $V_{CC} = 0V$  and  $V_{LI} = 0V$ . In this state, the contents of SRAM are not battery-backed and are undefined.

69	PROG Low to Active	$t_{ m PRA}$	48		CLKS
70	PROG High to Inactive	$t_{PRI}$	48		CLKS

## **RPC TIMING MODE**

#### NOTES:

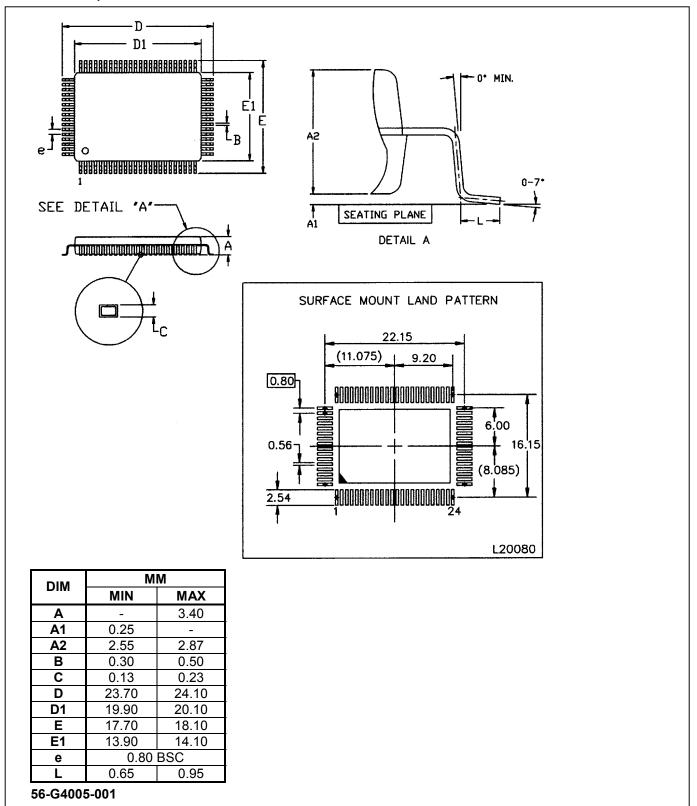

All parameters apply to both commercial and industrial temperature operation unless otherwise noted.

- 1) All voltages are referenced to ground.
- 2) Maximum operating  $I_{CC}$  is measured with all output pins disconnected; XTAL1 driven with  $t_{CLKR}$ ,  $t_{CLKF} = 10$ ns,  $V_{IL} = 0.5$ V; XTAL2 disconnected; RST = PORT0 =  $V_{CC}$ , MSEL =  $V_{SS}$ .
- 3) Idle mode,  $I_{IDLE}$ , is measured with all output pins disconnected; XTAL1 driven with  $t_{CLKR}$ ,  $t_{CLKF} = 10$ ns,  $V_{IL} = 0.5$ V; XTAL2 disconnected; PORT0 =  $V_{CC}$ , RST = MSEL =  $V_{SS}$ .
- 4) Stop mode,  $I_{STOP}$ , is measured with all output pins disconnected; PORT0 =  $V_{CC}$ ; XTAL2 not connected; RST = MSEL = XTAL1 =  $V_{SS}$ .
- 5) Pin capacitance is measured with a test frequency: 1MHz,  $T_A = +25$ °C.
- 6)  $I_{CCO1}$  is the maximum average operating current that can be drawn from  $V_{CCO}$  in normal operation.
- 7)  $I_{LI}$  is the current drawn from  $V_{LI}$  input when  $V_{CC} = 0V$  and  $V_{CCO}$  is disconnected.
- 8)  $V_{CCO2}$  is measured with  $V_{CC} < V_{LI}$ , and a maximum load of  $10\mu A$  on  $V_{CCO}$ .
- 9) Crystal startup time is the time required to get the mass of the crystal into vibrational motion from the time that power is first applied to the circuit until the first clock pulse is produced by the on-chip oscillator. The user should check with the crystal vendor for a worst-case specification on this time.
- 10) This parameter applies to industrial temperature operation.
- 11)  $\overline{PF}$  pin operation is specified with  $V_{BAT} \ge 3.0 V$ .

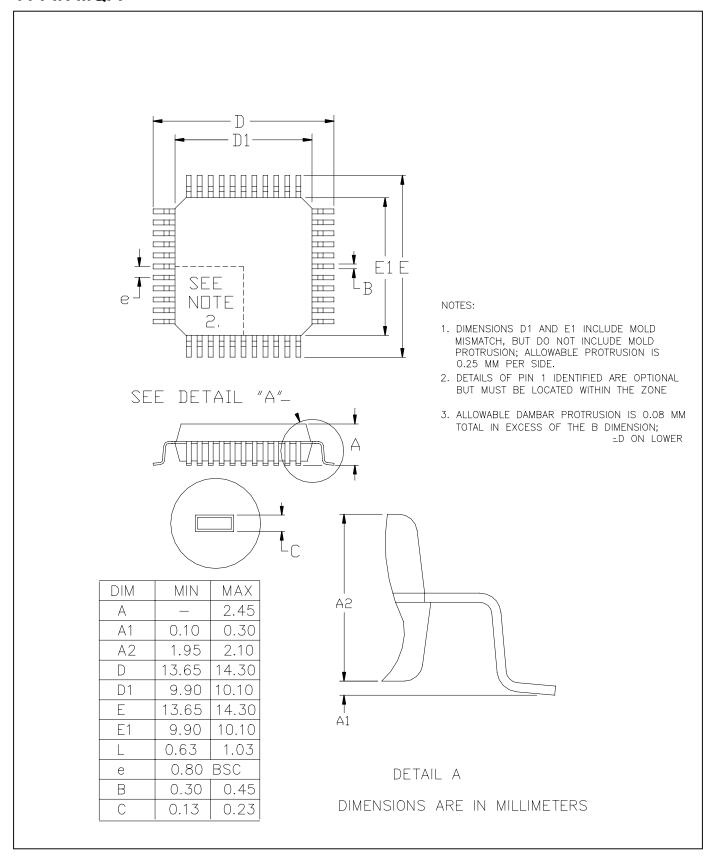

#### **PACKAGE INFORMATION**

(The package drawing(s) in this data sheet may not reflect the most current specifications. For the latest package outline information, go to <a href="https://www.maxim-ic.com/DallasPackInfo">www.maxim-ic.com/DallasPackInfo</a>.)

## **80-PIN MQFP**

#### 44-PIN MQFP

#### REVISION HISTORY

The following represent the key differences between the 112795 and 073096 version of the DS5001FP data sheet. Please review this summary carefully.

- 1) Change  $V_{CC02}$  specification from  $V_{LI}$  0.5 to  $V_{LI}$  0.65 (PCN F62501).
- 2) Update mechanical specifications.

The following represent the key differences between the 073096 and 111996 version of the DS5001FP data sheet. Please review this summary carefully.

1) Change  $V_{CC01}$  from  $V_{CC}$  - 0.3 to  $V_{CC}$  - 0.35.

The following represent the key differences between the 111996 and 061297 version of the DS5001FP data sheet. Please review this summary carefully.

- 1) PF signal moved from V<sub>OL2</sub> test specification to V<sub>OL1</sub>. PCN No. (D72502)
- 2) AC characteristics for battery-backed SDI pulse specification added.

The following represent the key differences between the 061297 and 051099 version of the DS5001FP data sheet. Please review this summary carefully.

- 1) Reduced absolute maximum voltage to  $V_{CC} + 0.5V$ .
- 2) Added note clarifying storage temperature specification is for non-battery-backed state.
- 3) Changed  $R_{RE}$  min (industrial temp range) from  $40k\Omega$  to  $30k\Omega$ .
- 4) Changed  $V_{PFW}$  max (industrial temp range) from 4.5V to 4.6V.
- 5) Added industrial specification for I<sub>LI</sub>.
- 6) Reduced  $t_{CE1HOV}$  and  $t_{CEHDV}$  from 10ns to 0ns.

The following represent the key differences between the 051099 and 052499 version of the DS5001FP data sheet. Please review this summary carefully.

1) Minor markups and ready for approval.

The following represent the key differences between the 052499 and 052302 version of the DS5001FP data sheet. Please review this summary carefully.

- 1) Added information relating to 44-pin package.
- 2) Updated V<sub>CCO1</sub> and I<sub>CCO1</sub> specifications to reflect 0.45V internal voltage drop instead of 0.35V.

The following represent the key differences between the 052302 and 070605 version of the DS5001FP data sheet. Please review this summary carefully.

- 1) Added Pb-free part to Ordering Information table.
- 2) Added operating voltage specification. (This is not a new specification because operating voltage is implied in the testing limits, but rather a clarification.)
- 3) Updated Absolute Maximum Ratings soldering temperature to reference JEDEC standard.
