Keep safety first in your circuit designs!

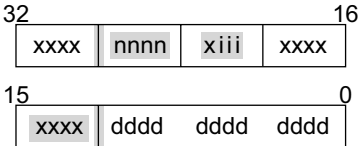

1. Renesas Technology Corp. puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage.
Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of nonflammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

1. These materials are intended as a reference to assist our customers in the selection of the Renesas Technology Corp. product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Renesas Technology Corp. or a third party.
2. Renesas Technology Corp. assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts, programs, algorithms, or circuit application examples contained in these materials.
3. All information contained in these materials, including product data, diagrams, charts, programs and algorithms represents information on products at the time of publication of these materials, and are subject to change by Renesas Technology Corp. without notice due to product improvements or other reasons. It is therefore recommended that customers contact Renesas Technology Corp. or an authorized Renesas Technology Corp. product distributor for the latest product information before purchasing a product listed herein.
The information described here may contain technical inaccuracies or typographical errors. Renesas Technology Corp. assumes no responsibility for any damage, liability, or other loss rising from these inaccuracies or errors.
Please also pay attention to information published by Renesas Technology Corp. by various means, including the Renesas Technology Corp. Semiconductor home page (<http://www.renesas.com>).
4. When using any or all of the information contained in these materials, including product data, diagrams, charts, programs, and algorithms, please be sure to evaluate all information as a total system before making a final decision on the applicability of the information and products. Renesas Technology Corp. assumes no responsibility for any damage, liability or other loss resulting from the information contained herein.
5. Renesas Technology Corp. semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Renesas Technology Corp. or an authorized Renesas Technology Corp. product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
6. The prior written approval of Renesas Technology Corp. is necessary to reprint or reproduce in whole or in part these materials.
7. If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.
Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
8. Please contact Renesas Technology Corp. for further details on these materials or the products contained therein.

Main Revisions for this Edition

| Item | Page | Revision (See Manual for Details) | | | | | | | | | | | | | | | |
|---|-------------|---|--------------------------|--|--|--------------------------|------|------------|---------------------|-----------------|-------------|---|-------------------|--|--|--|---------------|
| 1.1 Features | 1 | Description amended The SH-2A/SH2A-FPU is a 32-bit RISC (reduced instruction set computer) microprocessor that is upward-compatible with the SH-1, SH-2, and SH-2E at the object code level. | | | | | | | | | | | | | | | |
| 2.2.2 Control Registers (1) Status Register, SR | 5 | Description amended (32-bit, initial value =0000 0000 0000 0000 00X0 00XX 1111 00XX) | | | | | | | | | | | | | | | |
| 3.1.1 Exception Handling Types and Priority Table 3.1 Exception Types and Priority | 16 | Note amended Notes: 1. Delayed branch instructions: JMP, JSR, BRA, BSR, RTS, RTE, BF/S, BT/S, BSRF, BRAF | | | | | | | | | | | | | | | |
| 3.1.2 Exception Handling Operation (2) Address Error, RAM Error, Register Bank Error, Interrupt, or Instruction Exception Handling | 18 | Description amended ... and the vector table address offset of the interrupt exception handling to be executed,... | | | | | | | | | | | | | | | |
| 3.3.1 Address Error Sources Table 3.5 Bus Cycles and Address Errors | 22 | Table amended <table border="1"> <thead> <tr> <th colspan="3">Bus Cycle</th> <th rowspan="2">Address Error Occurrence</th> </tr> <tr> <th>Type</th> <th>Bus Master</th> <th>Bus Cycle Operation</th> </tr> </thead> <tbody> <tr> <td>Data read/write</td> <td>CPU or DMAC</td> <td>Double longword data accessed from double longword boundary</td> <td>No error (normal)</td> </tr> <tr> <td></td> <td></td> <td>Double longword data accessed from other than double longword boundary</td> <td>Address error</td> </tr> </tbody> </table> | Bus Cycle | | | Address Error Occurrence | Type | Bus Master | Bus Cycle Operation | Data read/write | CPU or DMAC | Double longword data accessed from double longword boundary | No error (normal) | | | Double longword data accessed from other than double longword boundary | Address error |
| Bus Cycle | | | Address Error Occurrence | | | | | | | | | | | | | | |
| Type | Bus Master | Bus Cycle Operation | | | | | | | | | | | | | | | |
| Data read/write | CPU or DMAC | Double longword data accessed from double longword boundary | No error (normal) | | | | | | | | | | | | | | |
| | | Double longword data accessed from other than double longword boundary | Address error | | | | | | | | | | | | | | |
| 3.6.3 Interrupt Exception Handling | 26 | Description amended ... and the vector table address offset of the interrupt exception handling to be executed,... | | | | | | | | | | | | | | | |

| Item | Page | Revision (See Manual for Details) | | | | | | |

Section 1 Overview

1.1 Features

The SH-2A/SH2A-FPU is a 32-bit RISC (reduced instruction set computer) microprocessor that is upward-compatible with the SH-1, SH-2, and SH-2E at the object code level. The SH2A-FPU has an on-chip floating point unit and the SH-2A does not. The use of 16-bit basic instructions enables code efficiency, performance, and ease of use to be improved.

Features of the SH-2A/SH2A-FPU are summarized in table 1.1.

Table 1.1 SH-2A/SH2A-FPU Features

Section 2 Programming Model

2.1 Data Formats

Data formats supported by the SH-2A/SH2A-FPU are shown in figure 2.1.

Figure 2.1 Data Formats

2.2 Register Configuration

2.2.1 General Registers

Figure 2.2 shows the general registers. There are 16 general registers (R_n) numbered R_0 to R_{15} , which are 32 bits in length. General registers are used for data processing and address calculation. R_0 is also used as an index register. Several instructions use R_0 as a fixed source or destination register. R_{15} is used as the hardware stack pointer (SP). Saving and recovering the status register (SR) and program counter (PC) in exception processing is accomplished by referencing the stack using R_{15} .

| | |
|------------------------------------|---|
| 31 | 0 |
| R0*1 | |
| R1 | |
| R2 | |
| R3 | |
| R4 | |
| R5 | |
| R6 | |
| R7 | |
| R8 | |
| R9 | |
| R10 | |
| R11 | |
| R12 | |
| R13 | |
| R14 | |
| R15, SP (hardware stack pointer)*2 | |

- Notes:
1. R0 functions as an index register in the indirect indexed register addressing mode and indirect indexed GBR addressing mode. In some instructions, R0 functions as a fixed source register or destination register.
 2. R15 functions as a hardware stack pointer (SP) during exception processing.

Figure 2.2 General Registers

2.2.2 Control Registers

There are four control registers, each 32 bits in length: the status register (SR), global base register (GBR), vector base register (VBR), and jump table base register (TBR).

The status register indicates the processing status of instructions.

The global base register is used as the base address in the GBR indirect addressing mode and to transfer register data from on-chip peripheral modules.

The vector base register is used as the base address for the exception processing vector area, including interrupts.

The table base register is used as the base address for the function table area.

(1) Status Register, SR

(32-bit, initial value = 0000 0000 0000 0000 00X0 00XX 1111 00XX) (X = undefined)

| | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|--|--|--|--|--|--|--|--|--|--|----|----|----|----|----|----|---|-------|---|--|---|--|---|---|---|---|---|
| 31 | | | | | | | | | | | | 15 | 14 | 13 | 12 | 10 | 9 | 8 | 7 | | | | 4 | 3 | 2 | 1 | 0 |
| — | | | | | | | | | | | BO | CS | — | | | M | Q | IMASK | | | — | | | S | T | | |

Note: —: Reserved bits. Always read as 0. The write value should always be 0.

BO: Indicates that a register bank has overflowed.

CS: Indicates that, in CLIP instruction execution, the value has exceeded the saturation upper-limit value or fallen below the saturation lower-limit value.

M, Q: Used by the DIV0S, DIV0U, and DIV1 instructions.

IMASK: Interrupt mask level

S: Specifies a saturation operation for a MAC instruction.

T: True/false condition or carry/borrow bit

(2) Global Base Register, GBR (32-bit, initial value = undefined)

GBR is referenced as the base address in a GBR-referencing MOV instruction.

(3) Vector Base Register, VBR (32-bit, initial value = H'0000 0000)

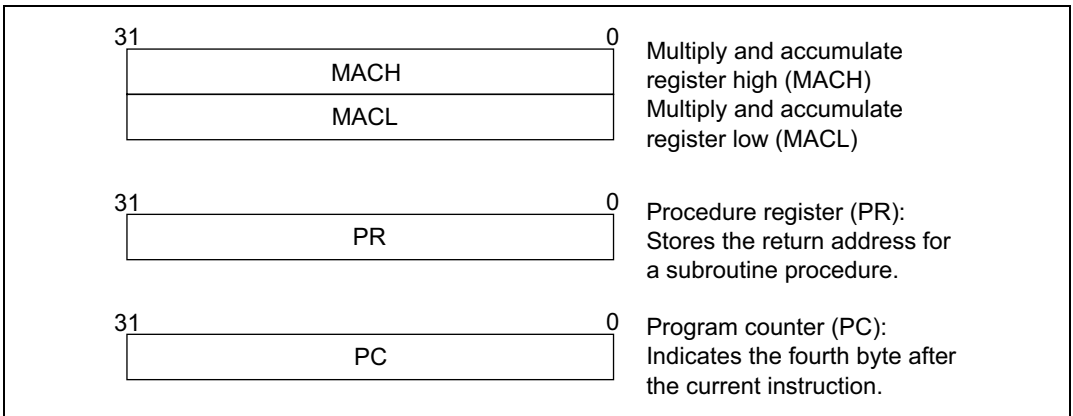

VBR is referenced as the branch destination base address in the event of an exception or interrupt.

(4) Jump Table Base Register, TBR (32-bit, initial value = undefined)

TBR is referenced as the start address of a function table located in memory in a JSR/N @@(disp8,TBR) table referencing subroutine call instruction.

2.2.3 System Registers

System registers consist of four 32-bit registers: high and low multiply and accumulate registers (MACH and MACL), the procedure register (PR), and the program counter (PC). The multiply and accumulate registers store the results of multiply and multiply and accumulate operations. The procedure register stores the return address from the subroutine procedure. The program counter indicates the address of the program executing and controls the flow of the processing.

(1) Multiply and Accumulate Register High, MACH (32-bit, initial value = undefined)
Multiply and Accumulate Register Low, MACL (32-bit, initial value = undefined)

MACH/MACL is used as the addition value in a MAC instruction, and to store the operation result of a MAC or MUL instruction.

(2) Procedure Register, PR (32-bit, initial value = undefined)

PR stores the return address of a subroutine call using a BSR, BSRF, or JSR instruction, and is referenced by a subroutine return instruction (RTS).

(3) Program Counter, PC (32-bit, initial value = value of PC in vector table)

The PC indicates the address of the instruction being executed.

2.2.4 Floating-Point Registers

Figure 2.3 shows the floating-point registers. There are sixteen 32-bit floating-point registers, FPR0 to FPR15. These sixteen registers are referenced as FR0 to FR15 and DR0/2/4/6/8/10/12/14. The correspondence between FPRn and the reference name is determined by the PR bit and SZ bit in FPSCR. See figure 2.3.

(1) Floating-Point Registers, FPRn (16 Registers)

FPR0, FPR1, FPR2, FPR3, FPR4, FPR5, FPR6, FPR7,
FPR8, FPR9, FPR10, FPR11, FPR12, FPR13, FPR14, FPR15

(2) Single-Precision Floating-Point Registers, FRi (16 Registers)

FR0 to FR15 are assigned to FPR0 to FPR15.

(3) Double-Precision Floating-Point Registers or Single-Precision Floating-Point Register Pairs, DRi (8 Registers)

A DR register is composed of two FR registers.

DR0 = (FPR0, FPR1), DR2 = (FPR2, FPR3),
DR4 = (FPR4, FPR5), DR6 = (FPR6, FPR7),
DR8 = (FPR8, FPR9), DR10 = (FPR10, FPR11),
DR12 = (FPR12, FPR13), DR14 = (FPR14, FPR15)

| | Reference Name | Register Name |
|--|----------------|---------------|
| In case of transfer instruction: | FPSCR.SZ = 0 | FPSCR.SZ = 1 |
| In case of arithmetic/logical instruction: | FPSCR.PR = 0 | FPSCR.PR = 1 |
| FR0 | DR0 | FPR0 |
| FR1 | | FPR1 |
| FR2 | DR2 | FPR2 |
| FR3 | | FPR3 |
| FR4 | DR4 | FPR4 |
| FR5 | | FPR5 |
| FR6 | DR6 | FPR6 |
| FR7 | | FPR7 |
| FR8 | DR8 | FPR8 |
| FR9 | | FPR9 |
| FR10 | DR10 | FPR10 |
| FR11 | | FPR11 |
| FR12 | DR12 | FPR12 |
| FR13 | | FPR13 |
| FR14 | DR14 | FPR14 |
| FR15 | | FPR15 |

Figure 2.3 Floating-Point Registers

Programming Note:

The values of FPR0 to FPR15 are undefined after a reset.

2.2.5 Floating-Point System Registers**(1) Floating-Point Communication Register, FPUL (32-bit, initial value = undefined)**

Data transfers between an FPU register and CPU register are performed via FPUL.

(2) Floating-Point Status/Control Register, FPSCR (32-bit, initial value = H'0004 0001)

| | | | | | | | | | | | | | | | |
|----|----|----|----|-----|----|----|----|----|-------|---|---|--------|------|---|----|
| 31 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 12 | 11 | 7 | 6 | 2 | 1 | 0 | |
| — | | | | QIS | — | SZ | PR | DN | Cause | | | Enable | Flag | | RM |

QIS: sNaN is treated as qNaN or $\pm\infty$. Valid only when the V bit in the enable field of FPSCR is set to 1.

- QIS = 0: Processed as qNaN or $\pm\infty$.
- QIS = 1: Exception generated (processed same as sNaN).

SZ: Transfer Size Mode

- SZ = 0: The data size of an FMOV instruction is 32 bits.
- SZ = 1: The data size of an FMOV instruction is a 32-bit pair (64 bits).

PR: Precision Mode

- PR = 0: Floating-point instructions are executed as single-precision operations.
- PR = 1: Floating-point instructions are executed as double-precision operations (the result of an instruction for which double-precision is not supported is undefined).

DN: Denormalization Mode (always 1)

- DN = 1: A denormalized number is treated as zero.

Cause: FPU exception cause field

Enable: FPU exception enable field

Flag: FPU exception flag field

| | | FPU Error (E) | Invalid Operation (V) | Division by Zero (Z) | Overflow (O) | Underflow (U) | Inexact Exception (I) |
|--------|----------------------------|--------------------------|--------------------------------------|-------------------------------------|-------------------------|--------------------------|--------------------------------------|
| Cause | FPU exception cause field | Bit 17 | Bit 16 | Bit 15 | Bit 14 | Bit 13 | Bit 12 |
| Enable | FPU exception enable field | None | Bit 11 | Bit 10 | Bit 9 | Bit 8 | Bit 7 |
| Flag | FPU exception flag field | None | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 |

When an FPU operation instruction is executed, the FPU exception cause field is initially set to 0. When an FPU exception next occurs, the corresponding bit in the FPU exception cause field and FPU exception flag field is set to 1.

The FPU exception flag field retains the status of an exception generated after that field was last cleared.

RM: Rounding Mode

RM = 00: Round to Nearest

RM = 01: Round to Zero

RM = 10: Reserved

RM = 11: Reserved

Bits 21, 23 to 31: Reserved

Note: The SH-2A does not generate an FPU error.

2.2.6 Register Banks

For the nineteen 32-bit registers comprising general registers R0 to R14, control register GBR, and system registers MACH, MACL, and PR, high-speed register saving and restoration can be carried out using a register bank. Saving to the bank is performed automatically after the CPU accepts an interrupt that uses a register bank. Restoration from the bank is executed by issuing a RESBANK instruction in an interrupt service routine.

For details, refer to section 7, Register Banks.

2.2.7 Register Initial Values**Table 2.1 Initial Values of Registers**

| Classification | Register | Initial Value |
|---------------------------------|-----------------|--|
| General registers | R0–R14 | Undefined |
| | R15(SP) | SP value in the program address table |
| Control registers | SR | Bits I3–I0 are 1111 (H'F), BO, CS are 0, reserved bits are 0, and other bits are undefined |
| | GBR, TBR | Undefined |
| | VBR | H'00000000 |
| System registers | MACH, MACL, PR | Undefined |
| | PC | Value of the program counter in the vector address table |
| Floating-point registers | FRR0–FRR15 | Undefined |
| Floating-point system registers | FPUL | Undefined |
| | FPSCR | H'00040001 |

2.3 Data Formats

2.3.1 Data Format in Registers

Register operands are always longwords (32 bits). When data in memory is loaded to a register and the memory operand is only a byte (8 bits) or a word (16 bits), it is sign-extended into a longword when stored into a register.

2.3.2 Data Formats in Memory

Byte, word, and longword data formats are used. Memory can be accessed in 8-bit bytes, 16-bit words, or 32-bit longwords. A memory operand of fewer than 32 bits is stored in a register in sign-extended or zero-extended form.

A word operand should be accessed starting from a word boundary (2-byte even address: address $2n$), and a longword operand from a longword boundary (4-byte even address: address $4n$). If this rule is not observed, an address error will occur. A byte operand can be accessed from any address.

Only big-endian byte order can be selected for the data format.

Data formats in memory are shown in figure 2.4.

Figure 2.4 Data Format in Memory

2.3.3 Immediate Data Format

Byte immediate data is located in an instruction code. Immediate data accessed by the MOV, ADD, and CMP/EQ instructions is sign-extended and is handled in registers as longword data. Immediate data accessed by the TST, AND, OR, and XOR instructions is zero-extended and is handled as longword data. Consequently, AND instructions with immediate data always clear the upper 24 bits of the destination register.

20-bit immediate data is stored in the code of a MOVI20 or MOVI20S 32-bit transfer instruction. The MOVI20 instruction stores immediate data in the destination register in sign-extended form. The MOVI20S instruction shifts immediate data by 8 bits in the upper direction, and stores it in the destination register in sign-extended form.

Word or longword immediate data is not located in the instruction code but rather is stored in a memory table. The memory table is accessed by a immediate data transfer instruction (MOV) using the PC relative addressing mode with displacement.

Specific examples are given in 4.1, (10) Immediate Data in section 4, Instruction Features.

2.4 Processing States

The CPU has five processing states: the reset state, exception handling state, bus-released state, program execution state, and power-down state. Figure 2.5 shows the state transitions.

Figure 2.5 Processing State Transitions

(1) Reset State

In this state, the CPU is reset. There are two kinds of reset, power-on and manual. See the Hardware Manual for details.

(2) Exception Handling State

The exception handling state is a transient state that occurs when the CPU alters the normal programming flow due to a reset, interrupt, or other exception handling source.

In the case of a reset, the CPU fetches the execution start address as the initial value of the program counter (PC) from the exception vector table, and the initial value of the stack pointer (SP), stores these values, branches to the start address, and begins program execution at that address.

In the case of an interrupt, etc., the CPU references the SP and saves the PC and status register (SR) in the stack area. It fetches the start address of the exception service routine from the exception vector table, branches to that address, and begins program execution.

Subsequently, the processing state is the program execution state.

(3) Program Execution State

In the program execution state the CPU executes program instructions in the normal sequence.

(4) Power-Down State

In the power-down state the CPU stops operating to conserve power. Sleep mode or software standby mode is entered by executing a SLEEP instruction. If hardware standby input is received, the CPU enters the hardware standby mode.

(5) Bus-Released State

In the bus-released state, the CPU releases the bus to a device that has requested it.

Note: For information on the processing states, please refer to the hardware manual for the product in question.

Section 3 Exception Handling

3.1 Overview

3.1.1 Exception Handling Types and Priority

As table 3.1 indicates, exception handling may be caused by a reset, address error, RAM error, register bank error, interrupt, or instruction. Exception handling is prioritized as shown in table 3.1. If two or more exceptions occur simultaneously, they are accepted and processed in order of priority.

Table 3.1 Exception Types and Priority

| | Exception Handling | Priority |
|----------------------|--|------------------|
| Reset | Power-on reset | High ↑ Low |
| | Manual reset | |
| Address errors | CPU address error | |
| | DMAC address error | |
| RAM errors | RAM error | |
| Instructions | FPU exception | |
| | Integer division exception (division by zero) | |
| | Integer division exception (overflow) | |
| Register bank errors | Bank underflow | |
| | Bank overflow | |
| Interrupts | NMI | |
| | User break | |
| | H-UDI | |
| | External interrupt (IRQ) | |
| | On-chip peripheral modules | |
| Instructions | Trap instruction (TRAPA instruction) | |
| | General illegal instruction (undefined code) | |
| | Slot illegal instruction (undefined code (FPU instruction or FPU-related CPU instruction in module standby status including FPU or in product with no FPU, or register bank-related instruction* ² in product with no register bank) located immediately after delayed branch instruction* ¹ , instruction that modifies PC* ³ , 32-bit instruction* ⁴ , RESBANK instruction, DIVS instruction, or DIVU instruction) | |

- Notes: 1. Delayed branch instructions: JMP, JSR, BRA, BSR, RTS, RTE, BF/S, BT/S, BSRF, BRAF
2. Register bank-related instructions: RESBANK, LDBANK, STBANK
3. Instructions that modify PC: JMP, JSR, BRA, BSR, RTS, RTE, BT, BF, TRAPA, BF/S, BT/S, BSRF, BRAF, JSR/N, RTV/N
4. 32-bit instructions: BAND.B, BANDNOT.B, BCLR.B, BLD.B, BLDNOT.B, BOR.B, BORNOT.B, BSET.B, BST.B, BXOR.B, FMOV.S @disp12, FMOV.D @disp12, MOV.B @disp12, MOV.W @disp12, MOV.L @disp12, MOVI20, MOVI20S, MOVU.B, MOVU.W

3.1.2 Exception Handling Operation

Table 3.2 shows the timing of detection and the start of exception handling for each exception source.

Table 3.2 Timing of Exception Source Detection and Start of Exception Handling

| Exception Handling | | Exception Source Detection and Start of Exception Handling |
|---------------------|--------------------------------------|---|
| Reset | Power-on reset | Started by detection of power-on reset condition |
| | Manual reset | Started by detection of manual reset condition |
| Address error | | Detected when instruction is decoded; exception handling is started after completion of currently executing instruction |
| RAM error | | |
| Interrupt | | |
| Register bank error | Bank underflow | Started upon attempted execution of RESBANK instruction when save has not been performed to register bank |
| | Bank overflow | Started when save has already been performed to all register bank areas when acceptance of register overflow exception has been set by interrupt controller, and interrupt that uses register bank is generated and accepted by CPU |
| Instruction | Trap instruction | Started by execution of TRAPA instruction |
| | General illegal instruction | Started when undefined code (FPU instruction or FPU-related CPU instruction in module standby status including FPU or in product with no FPU, or register bank-related instruction in product with no register bank) not immediately following delayed branch instruction (delay slot) is decoded |
| | Slot illegal instruction | Started when undefined code (FPU instruction or FPU-related CPU instruction in module standby status including FPU or in product with no FPU, or register bank-related instruction in product with no register bank) not immediately following delayed branch instruction (delay slot), instruction that modifies PC, 32-bit instruction, RESBANK instruction, DIVS instruction, or DIVU instruction is decoded |
| | Integer division instruction | Started upon detection of division-by-zero exception or overflow exception caused by dividing negative maximum value (H'80000000) by -1 |
| | Floating-point operation instruction | Started by floating-point operation instruction invalid operation exception (stipulated by IEEE754), or overflow, underflow, or imprecision interrupt. Also started when qNaN or $\pm\infty$ is input to a floating-point operation instruction source |

When exception handling is initiated, the CPU operates as follows.

(1) Reset Exception Handling

The initial values of the program counter (PC) and stack pointer (SP) are fetched from the exception vector table (addresses H'00000000 and H'00000004 in the case of a power-on reset, and addresses H'00000008 and H'0000000C in the case of a manual reset). See section 3.1.3, Exception Vector Table, for details of the exception vector table. Next, the vector base register is cleared to H'00000000, the interrupt mask bits (I3 to I0) in the status register (SR) are set to (H'F) (1111), and the BO and CS bits are initialized to 0. The BN bit in IBNR of INTC is also initialized to 0. In addition, in products with an FPU, FPSCR is initialized to H'00040001. Program execution starts from the PC address fetched from the exception vector table.

(2) Address Error, RAM Error, Register Bank Error, Interrupt, or Instruction Exception Handling

SR and PC are saved on the stack indicated by R15. In interrupt exception handling other than NMI and UBC, when register bank use has been set, general registers R0 to R14, control register GBR, system registers MACH, MACL, and PR, and the vector table address offset of the interrupt exception handling to be executed, are saved to the register bank. In the case of exception handling due to an address error, RAM error, register bank error, NMI interrupt or UBC interrupt, saving to a register bank is not performed. Also, when saving is performed to all register banks, automatic saving to the stack is performed instead of register bank saving. In this case, an interrupt controller setting must have been made for register bank overflow exceptions not to be accepted. If a setting has been made for register bank overflow exceptions to be accepted, a register bank overflow exception will be generated. In the case of interrupt exception handling, the interrupt priority level is written to the interrupt mask bits (I3 to I0) in SR. In address error, RAM error, and instruction exception handling, bits I3 to I0 are not affected. Next, the start address is fetched from the exception vector table and program execution is started from that address.

3.1.3 Exception Vector Table

Before exception handling is executed, the exception vector table must have been set up in memory. The exception vector table holds the start addresses of the exception service routines (the reset exception handling table holds the initial values of PC and SP).

A different vector number and vector table address offset are assigned to each exception source. The vector table address is calculated from the corresponding vector number and vector table address offset. In exception handling, the start address of the exception service routine is fetched from the exception vector table entry indicated by this vector table address.

The vector numbers and vector table address offsets are shown in table 3.3, and the method of calculating the vector table address in table 3.4.

Table 3.3 Exception Vector Table

| Exception Source | | Vector Number | Vector Table Address Offset |
|---|------------|---------------|-----------------------------|
| Power-on reset | PC | 0 | H'00000000 to H'00000003 |
| | SP | 1 | H'00000004 to H'00000007 |
| Manual reset | PC | 2 | H'00000008 to H'0000000B |
| | SP | 3 | H'0000000C to H'0000000F |
| General illegal instruction | | 4 | H'00000010 to H'00000013 |
| RAM error | | 5 | H'00000014 to H'00000017 |
| Slot illegal instruction | | 6 | H'00000018 to H'0000001B |
| (Reserved for system) | | 7 | H'0000001C to H'0000001F |
| | | 8 | H'00000020 to H'00000023 |
| CPU address error | | 9 | H'00000024 to H'00000027 |
| DMAC address error | | 10 | H'00000028 to H'0000002B |
| Interrupt | NMI | 11 | H'0000002C to H'0000002F |
| | User break | 12 | H'00000030 to H'00000033 |
| FPU exception | | 13 | H'00000034 to H'00000037 |
| H-UDI | | 14 | H'00000038 to H'0000003B |
| Bank overflow | | 15 | H'0000003C to H'0000003F |
| Bank underflow | | 16 | H'00000040 to H'00000043 |
| Integer division exception (division by zero) | | 17 | H'00000044 to H'00000047 |
| Integer division exception (overflow) | | 18 | H'00000048 to H'0000004B |
| (Reserved for system) | | 19 | H'0000004C to H'0000004F |
| | | • | • |
| Trap instruction (user vector) | | 31 | H'0000007C to H'0000007F |
| | | • | • |
| External interrupt (IRQ), on-chip peripheral module* | | 63 | H'000000FC to H'000000FF |
| | | • | • |
| 511 | | | H'000007FC to H'000007FF |

Note: * For the vector numbers and address offsets of external interrupts and on-chip peripheral module interrupts, see “Internal Module Interrupt Exception Handling Vectors and Priority Order” in the Interrupt Controller section of the hardware manual.

Table 3.4 Exception Vector Table Address Calculation

| Exception Source | Vector Table Address Calculation |
|---|---|
| Reset | Vector table address = (vector table address offset) = (vector number) × 4 |
| Address error, RAM error, register bank error, interrupt, instruction | Vector table address = VBR + (vector table address offset) = VBR + (vector number) × 4 |

Note: VBR: Vector base register

Vector table address offset: See table 3.3.

Vector number: See table 3.3.

3.2 Resets

3.2.1 Types of Reset

A reset is the highest-priority exception handling source. There are two types of reset: a power-on reset and a manual reset. The CPU state is initialized by both a power-on reset and a manual reset. The FPU state is initialized by a power-on reset, but not by a manual reset. Refer to the hardware manual of the relevant product for information on the states of on-chip peripheral modules, the PFC, and I/O ports.

3.2.2 Power-On Reset

When a power-on reset condition is detected, the chip enters the power-on reset state. See “Power-On Reset” in the Exception Handling section of the hardware manual for the relevant product for details of power-on reset conditions.

When the power-on reset state is released, power-on reset exception handling is started. CPU operations are as follows.

1. The initial value of the program counter (PC) (i.e. the execution start address) is fetched from the exception vector table.
2. The initial value of the stack pointer (SP) is fetched from the exception vector table.
3. The vector base register (VBR) is cleared to H'00000000, the interrupt mask bits (I3 to I0) in the status register (SR) are set to (HF) (1111), and the BO and CS bits are initialized to 0. The BN bit in IBNR of INTC is also initialized to 0. In addition, in products with an FPU, FPSCR is initialized to H'00040001.

4. The values fetched from the exception vector table are set in the program counter (PC) and stack pointer (SP), and program execution is started.

Power-on reset processing must always be executed when the system is powered on.

3.2.3 Manual Reset

When a manual reset condition is detected, the chip enters the manual reset state. See “Manual Reset” in the Exception Handling section of the hardware manual for the relevant product for details of manual reset conditions.

When the manual reset state is released, manual reset exception handling is started. CPU operations are as follows.

1. The initial value of the program counter (PC) (i.e. the execution start address) is fetched from the exception vector table.
2. The initial value of the stack pointer (SP) is fetched from the exception vector table.
3. The vector base register (VBR) is cleared to H'00000000, the interrupt mask bits (I3 to I0) in the status register (SR) are set to (H'F) (1111), and the BO and CS bits are initialized to 0. The BN bit in IBNR of INTC is also initialized to 0.
4. The values fetched from the exception vector table are set in the program counter (PC) and stack pointer (SP), and program execution is started.

When a manual reset occurs, the bus cycle is held. If a manual reset occurs while the bus is released or during a DMAC burst transfer, manual reset exception handling is held pending until the CPU acquires the bus. However, if the interval from occurrence of a manual reset until the end of a bus cycle exceeds a given number of cycles, the internal manual reset source is not held pending but is ignored, and manual reset exception handling is not performed. See “Manual Reset” in the Exception Handling section of the hardware manual for the relevant product for details.

A manual reset initializes the CPU and the BN bit in IBNR of the INTC. The FPU and other modules are not initialized.

3.3 Address Errors

3.3.1 Address Error Sources

Address errors occur in instruction fetches and data read/write accesses, as shown in table 3.5.

Table 3.5 Bus Cycles and Address Errors

| Bus Cycle | | Bus Cycle Operation | Address Error Occurrence |
|--|---------------|--|--------------------------|
| Type | Bus Master | | |
| Instruction fetch | CPU | Instruction fetched from even address | No error (normal) |
| | | Instruction fetched from odd address | Address error |
| | | Instruction fetched from other than on-chip peripheral module space* | No error (normal) |
| | | Instruction fetched from on-chip peripheral module space* | Address error |
| | | Instruction fetched from external memory space in single-chip mode | Address error |
| Data read/write | CPU or DMAC | Word data accessed from even address | No error (normal) |
| | | Word data accessed from odd address | Address error |
| | | Longword data accessed from longword boundary | No error (normal) |
| | | Longword data accessed from other than longword boundary | Address error |
| | | Double longword data accessed from double longword boundary | No error (normal) |
| | | Double longword data accessed from other than double longword boundary | Address error |
| | | Word data or byte data accessed in on-chip peripheral module space* | No error (normal) |
| | | Longword data accessed in 16-bit on-chip peripheral module space* | No error (normal) |
| | | Longword data accessed in 8-bit on-chip peripheral module space* | No error (normal) |
| External memory space accessed in single-chip mode | Address error | | |

Note: * For details of the on-chip peripheral module space, see the Bus State Controller section of the hardware manual for the relevant product.

3.3.2 Address Error Exception Handling

When an address error occurs, address error exception handling is started after the end of the bus cycle in which the address error occurred and completion of the currently executing instruction. CPU operations are as follows.

1. The start address of the exception service routine corresponding to the address error is fetched from the exception handling vector table.
2. The status register (SR) is saved on the stack.
3. The program counter (PC) is saved on the stack. The saved PC value is the start address of the instruction following the last instruction executed.
4. Execution jumps to the address fetched from the exception handling vector table and program execution commences. The jump is not a delayed branch.

3.4 RAM Errors

3.4.1 RAM Error Sources

A RAM error occurs in the event of a software error in an on-chip RAM read access. For details, see “RAM Errors” in the Exception Handling section of the hardware manual for the relevant product.

3.4.2 RAM Error Exception Handling

When a RAM error occurs, RAM error exception handling is started after the end of the bus cycle in which the error occurred and completion of the currently executing instruction. CPU operations are as follows.

1. The start address of the exception service routine corresponding to the RAM error is fetched from the exception handling vector table.
2. The status register (SR) is saved on the stack.
3. The program counter (PC) is saved on the stack. The saved PC value is the start address of the instruction following the last instruction executed.
4. Execution jumps to the address fetched from the exception handling vector table and program execution commences. The jump is not a delayed branch.

3.5 Register Bank Errors

3.5.1 Register Bank Error Sources

(1) Bank Overflow

When a save has already been performed to all register bank areas when acceptance of register overflow exception has been set by interrupt controller, and an interrupt that uses a register bank is generated and is accepted by the CPU

(2) Bank Underflow

When an attempt is made to execute a RESBANK instruction when a save has not been performed to a register bank

3.5.2 Register Bank Error Exception Handling

Register bank error exception handling is started when a register bank error occurs. CPU operations are as follows.

1. The start address of the exception service routine corresponding to the register bank error is fetched from the exception handling vector table.
2. The status register (SR) is saved on the stack.
3. The program counter (PC) is saved on the stack. The saved PC value is the start address of the instruction following the last instruction executed, in the case of a bank overflow, or the start address of the executed RESBANK instruction, in the case of an underflow. To prevent multiple interrupts when a bank overflow occurs, the level of the interrupt that is the source of the bank overflow is written to the interrupt mask level bits (I3 to I0) in the status register (SR).
4. Execution jumps to the address fetched from the exception handling vector table and program execution commences. The jump is not a delayed branch.

3.6 Interrupts

3.6.1 Interrupt Sources

Interrupt exception handling can be initiated by an NMI, a user break, the H-UDI, an external interrupt, or an on-chip peripheral module, as shown in table 3.6.

Table 3.6 Interrupt Sources

| Type | Request Source | Number of Sources |
|--|--|-------------------|
| NMI | NMI pin (external input) | 1 |
| User break | User break controller | 1 |
| H-UDI | User debug interface | 1 |
| External interrupt (IRQ), on-chip peripheral module | External interrupt pin, on-chip peripheral module | See Note |

Each interrupt source is assigned a different vector number and vector table offset. For details of vector numbers and vector table address offsets, see “Interrupt Exception Vectors and Priority” in the Interrupt Controller section of the hardware manual for the relevant product.

Note: For details and numbers of external interrupts (IRQ) and on-chip peripheral module request sources, see “Interrupt Sources” in the Interrupt Controller section of the hardware manual for the relevant product.

3.6.2 Interrupt Priority

Interrupt sources are assigned priority levels. If a number of interrupts occur simultaneously (multiple interruption), the priority order is determined by the interrupt controller (INTC) and exception handling is initiated accordingly.

Interrupt source priority levels are expressed as values from 0 to 16, with 0 representing the lowest priority level and 16 the highest. The NMI interrupt is the highest-priority interrupt at level 16; it cannot be masked and is always accepted. The user break interrupt and H-UDI are assigned priority level 15. The priority level of IRQ interrupts and on-chip peripheral module interrupts can be set as desired in the interrupt priority level setting registers of the INTC (see table 3.7). Priority levels 0 to 15, but not 16, can be set. For details of the interrupt priority level setting registers, see the Interrupt Controller section of the hardware manual for the relevant product.

Table 3.7 Interrupt Priority Levels

| Type | Priority Level | Notes |
|--|----------------|---|
| NMI | 16 | Fixed priority level, not maskable |
| User break | 15 | Fixed priority level |
| H-UDI | 15 | Fixed priority level |
| External interrupt (IRQ), on-chip peripheral module | 0 to 15 | Can be set in interrupt priority level setting register |

3.6.3 Interrupt Exception Handling

When an interrupt occurs, its priority is determined by the interrupt controller (INTC). NMI is always accepted, but other interrupts are only accepted if their priority level is higher than the priority level set in the interrupt mask bits (I3 to I0) in the status register (SR).

When an interrupt is accepted, interrupt exception handling is started. In interrupt exception handling, the CPU saves SR and the program counter (PC) on the stack. In interrupt exception handling other than NMI, UBC, when register bank use has been set, general registers R0 to R14, control register GBR, system registers MACH, MACL, and PR, and the vector table address offset of the interrupt exception handling to be executed, are saved to the register bank. In the case of exception handling due to an address error, RAM error, register bank error, NMI interrupt, UBC interrupt, or instruction, saving to a register bank is not performed. Also, when saving is performed to all register banks, automatic saving to the stack is performed instead of register bank saving. In this case, an interrupt controller setting must have been made for register bank overflow exceptions not to be accepted. If a setting has been made for register bank overflow exceptions to be accepted, a register bank overflow exception will be generated. The interrupt priority level of the accepted interrupt is then written to bits I3 to I0 in SR. In the case of NMI, however, although its priority level is 16, H'F (level 15) is written to bits I3 to I0. Next, the CPU fetches the exception service routine start address from the exception vector table entry corresponding to the accepted interrupt, jumps to that address, and starts executing the exception service routine. For details of interrupt exception handling, see "Operation" in the Interrupt Controller section of the hardware manual for the relevant product.

3.7 Instruction Exceptions

3.7.1 Types of Instruction Exception

There are five kinds of instruction that can initiate exception handling: the TRAP instruction, slot illegal instructions, general illegal instructions, integer division instructions, and floating-point operation instructions. These are summarized in table 3.8.

Table 3.8 Instruction Exception Types

| Type | Source Instruction | Notes |
|--------------------------------------|--|--|
| Trap instruction | TRAPA | |
| Slot illegal instruction | Undefined code (FPU instruction or FPU-related CPU instruction in module standby status including FPU or in product with no FPU, or register bank-related instruction in product with no register bank) located immediately after delayed branch instruction (in delay slot), instruction that modifies PC, 32-bit instruction, RESBANK instruction, DIVS instruction, or DIVU instruction | <p>Delayed branch instructions: JMP, JSR, BRA, BSR, RTS, RTE, BF/S, BT/S, BSRF, BRAF</p> <p>Register bank-related instructions: RESBANK, LDBANK, STBANK</p> <p>Instructions that modify PC: JMP, JSR, BRA, BSR, RTS, RTE, BT, BF, TRAPA, BF/S, BT/S, BSRF, BRAF, JSR/N, RTV/N</p> <p>32-bit instructions: BAND.B, BANDNOT.B, BCLR.B, BLD.B, BLDNOT.B, BOR.B, BORNOT.B, BSET.B, BST.B, BXOR.B, FMOV.S @disp12, FMOV.D @disp12, MOV.B @disp12, MOV.W @disp12, MOV.L @disp12, MOVI20, MOVI20S, MOVU.B, MOVU.W</p> |
| General illegal instruction | Undefined code (FPU instruction, FPU-related CPU instruction, or register bank-related instruction in module standby status including FPU or in product with no FPU) not in delay slot | |
| Integer division exception | Division by zero | DIVU, DIVS |
| | Negative maximum value ÷ (-1) | DIVS |
| Floating-point operation instruction | Instruction causing invalid operation defined by IEEE754 standard or division-by-zero exception, instruction causing overflow, underflow, or inexact exception | FADD, FSUB, FMUL, FDIV, FMAC, FCMP/EQ, FCMP/GT, FLOAT, FTRC, FCNVDS, FCNVSD, FSQRT |

3.7.2 Trap Instruction

When a TRAPA instruction is executed, trap instruction exception handling is started. The CPU operates as follows.

1. The start address of the exception service routine corresponding to the vector number specified by the TRAPA instruction is fetched from the exception handling vector table.
2. The status register (SR) is saved on the stack.
3. The program counter (PC) is saved on the stack. The saved PC value is the start address of the instruction following the TRAPA instruction.
4. Execution jumps to the address fetched from the exception handling vector table and program execution commences. The jump is not a delayed branch.

3.7.3 Slot Illegal Instructions

An instruction located immediately after a delayed branch instruction is said to be located in the delay slot. If the instruction in the delay slot is undefined code, slot illegal instruction exception handling is started when that undefined code is decoded. Also, if the instruction in the delay slot is one that modifies the program counter (PC), slot illegal instruction exception handling is started when that instruction is decoded. Moreover, in the case of a product that does not have an FPU, or if the FPU is in the module standby state, a floating-point instruction or FPU-related instruction is treated as undefined code, and if located in a delay slot, will cause slot illegal instruction exception handling to be started when decoded. In addition, if the product that does not have a register bank, register bank-related instructions are treated as undefined code. If located in a delay slot, when decoded they will cause slot illegal instruction handling to be started.

Furthermore, if an instruction located in a delay slot is a 32-bit instruction, RESBANK instruction, DIVS instruction, or DIVU instruction, slot illegal instruction exception handling will be started when this instruction is decoded.

CPU operations in slot illegal instruction exception handling are as follows.

1. The start address of the exception service routine is fetched from the exception handling vector table.
2. The status register (SR) is saved on the stack.
3. The program counter (PC) is saved on the stack. The saved PC value is the jump destination address of the delayed branch instruction immediately preceding an undefined code, instruction that overwrites the PC, 32-bit instruction, RESBANK instruction, DIVS instruction, or DIVU instruction.
4. Execution jumps to the address fetched from the exception handling vector table and program execution commences. The jump is not a delayed branch.

3.7.4 General Illegal Instructions

When undefined code located other than immediately after a delayed branch instruction (in a delay slot) is decoded, general illegal instruction exception handling is started. Also, in the case of a product that does not have an FPU, or if the FPU is in the module standby state, a floating-point instruction or FPU-related instruction is treated as undefined code, and if located other than immediately after a delayed branch instruction (in a delay slot), will cause general illegal instruction exception handling to be started when decoded. In addition, if the product that does not have a register bank, register bank-related instructions are treated as undefined code. If not located immediately after a delayed branch instruction (in a delay slot), when decoded they will cause slot illegal instruction handling to be started.

The CPU follows the same procedure as in the case of slot illegal instruction exception handling, except that the PC value saved is the start address of the undefined code.

3.7.5 Integer Division Instructions

An integer division exception is generated if an integer division instruction executes division by zero, or if the result of integer division overflows. Instructions that may cause a division-by-zero exception are DIVU and DIVS. The only instruction that may cause an overflow exception is DIVS, the exception being generated if the negative maximum value is divided by -1 . CPU operations in integer division exception handling are as follows.

1. The start address of the exception service routine corresponding to the integer division exception is fetched from the exception handling vector table.
2. The status register (SR) is saved on the stack.
3. The program counter (PC) is saved on the stack. The saved PC value is the start address of the integer division instruction that generated the exception.
4. Execution jumps to the address fetched from the exception handling vector table and program execution commences. The jump is not a delayed branch.

3.7.6 Floating-Point Operation Instructions

An FPU exception is generated when the V, Z, O, U, or I bit in the enable field of the FPSCR register is set. This indicates the occurrence of an invalid operation exception defined by the IEEE754 standard, a division-by-zero exception, overflow (in the case of an instruction for which this is possible), underflow (in the case of an instruction for which this is possible), or an imprecision exception (in the case of an instruction for which this is possible).

Floating-point operation instructions that may cause an exception are as follows.

FADD, FSUB, FMUL, FDIV, FMAC, FCMP/EQ, FCMP/GT, FLOAT, FTRC, FCNVDS, FCNVSD, FSQRT

An FPU exception is generated only when the corresponding enable bit is set. When the FPU detects an exception, FPU operation is halted and exception generation is reported to the CPU. When exception handling is started, CPU operations are as follows.

1. The start address of the exception service routine stored in VBR + H'00000034 is fetched from the exception handling vector table.
2. SR contents are saved on the stack.
3. PC is saved on the stack. The PC value saved is the start address of the instruction following the last instruction executed.
4. Control branches to the address stored in VBR + H'00000034.

The exception flag bits in FPSCR are always updated regardless of whether or not an FPU exception has been accepted, and remain set until explicitly cleared by the user by means of an instruction. The FPSCR source bits change each time an FPU instruction is executed.

When the V bit in the enable field of the FPSCR register is set and the QIS bit in FPSCR is also set, FPU exception handling is started when qNaN or $\pm\infty$ is input to a floating-point operation instruction source.

3.8 Cases in Which Exceptions Are Not Accepted

There are cases, as shown in table 3.9, in which, if an address error, RAM error, FPU exception, register bank error (overflow), or interrupt occurs immediately after a delayed branch instruction, the exception is not accepted immediately, but is held pending. In such cases, the exception will be accepted when an instruction for which exception acceptance is permitted is decoded.

Table 3.9 Exception Source Occurrence Immediately after Delayed Branch Instruction

| Point of Occurrence | Exception Source | | | | |
|---|------------------|-----------|---------------|--------------------------------|-----------|
| | Address Error | RAM Error | FPU Exception | Register Bank Error (Overflow) | Interrupt |
| Immediately after a delayed branch instruction* | × | × | × | × | × |

Notes: ×: Not accepted

* Delayed branch instructions: JMP, JSR, BRA, BSR, RTS, RTE, BF/S, BT/S, BSRF, BRAF

3.9 Stack Status after Exception Handling

Table 3.10 shows the stack status after completion of exception handling.

Table 3.10 Stack Status after Exception Handling

| Type | Stack Status | Type | Stack Status |
|---------------------------------|--------------|---|--------------|
| Address error | | Interrupt | |
| RAM error | | Register bank error (overflow) | |
| Register bank error (underflow) | | Integer division instruction (division by zero, overflow) | |
| Trap instruction | | Slot illegal instruction | |
| General illegal instruction | | FPU exception | |

3.10 Usage Notes

3.10.1 Stack Pointer (SP) Value

Ensure that the stack pointer (SP) value is a multiple of 4. If it is not, an address error will be caused when the stack is accessed in exception handling.

3.10.2 Vector Base Register (VBR) Value

Ensure that the vector base register (VBR) value is a multiple of 4. If it is not, an address error will be caused when the vector is accessed in exception handling.

3.10.3 Address Errors Occurring in Address Error Exception Handling Stacking

If the stack pointer (SP) value is not a multiple of 4, an address error will occur in exception handling (interrupt, etc.) stacking, and after the exception handling is completed, address error exception handling will be started. An address error will also occur in stacking in the address error exception handling, but this address error will not be accepted in order to prevent endless stacking due to address errors. This enables program control to be switched to the address error exception service routine, and error handling to be carried out.

When an address error occurs in exception handling stacking, the stacking bus cycle (write) is executed. In SR and PC stacking, SP is decremented by 4 in each case, and therefore the SP value is not a multiple of 4 after stacking is completed. Also, the address value output in stacking is the SP value, and the actual address at which the error occurred is output. In this case, the stacked write data is undefined.

Section 4 Instruction Features

4.1 RISC-Type Instruction Set

All instructions are RISC type. Their features are detailed in this section.

(1) 16-Bit Fixed-Length Instructions

Basic instructions have a fixed length of 16 bits, increasing program code efficiency.

(2) Addition of 32-Bit Fixed-Length Instructions

The SH-2A/SH2A-FPU features the addition of 32-bit fixed-length instructions, improving performance and ease of use.

(3) One Instruction/Cycle

Basic instructions can be executed in one cycle using the pipeline system.

(4) Data Length

Longword is the standard data length for all operations. Memory can be accessed in bytes, words, or longwords. Byte or word data accessed from memory is sign-extended and calculated with longword data. Immediate data is sign-extended for arithmetic operations or zero-extended for logic operations. It also is calculated with longword data.

Table 4.1 Sign Extension of Word Data

| SH-2A/SH2A-FPU CPU | Description | Example for Other CPU |
|----------------------|--|-----------------------|
| MOV.W @ (disp,PC),R1 | Data is sign-extended to 32 bits, and R1 becomes H'00001234. It is next operated upon by an ADD instruction. | ADD.W #H'1234,R0 |
| ADD R1,R0 | | |
| | | |
| .DATA.W H'1234 | | |

Note: The address of the immediate data is accessed by @(disp, PC).

(5) Load-Store Architecture

Basic operations are executed between registers. For operations that involve memory access, data is loaded to the registers and executed (load-store architecture). Instructions such as AND that manipulate bits, however, are executed directly in memory.

(6) Delayed Branching

With the exception of some instructions, unconditional branch instructions, etc., are executed as delayed branches. With a delayed branch instruction, the branch is made after execution of the instruction immediately following the delayed branch instruction. This reduces disruption of the pipeline when a branch is made.

In a delayed branch, the actual branch operation occurs after execution of the slot instruction. However, instruction execution for register updating, etc., excluding the branch operation, is performed in delayed branch instruction → delay slot instruction order. For example, even though the contents of the register holding the branch destination address are changed in the delay slot, the branch destination address remains as the register contents prior to the change.

Table 4.2 Delayed Branch Instructions

| SH-2A/SH2A-FPU CPU | | Description | Example of Other CPU | |
|--------------------|-------|---|----------------------|-------|
| BRA | TRGET | ADD is executed before branch to TRGET. | ADD.W | R1,R0 |
| ADD | R1,R0 | | BRA | TRGET |

(7) Addition of Unconditional Branch Instructions with No Delay Slot

The SH-2A/SH2A-FPU features the addition of unconditional branch instructions in which a delay slot instruction is not executed. This makes it possible to cut down on the number of unnecessary NOP instructions, and so reduce the code size.

(8) Multiplication/Accumulation Operation

16bit × 16bit → 32-bit multiplication operations are executed in one to two cycles. 16bit × 16bit + 64bit → 64-bit multiplication/accumulation operations are executed in two to three cycles. 32bit × 32bit → 64-bit multiplication and 32bit × 32bit + 64bit → 64-bit multiplication/accumulation operations are executed in two to four cycles.

(9) T Bit

The T bit in the status register changes according to the result of the comparison, and in turn is the condition (true/false) that determines if the program will branch. The number of instructions after T bit in the status register is kept to a minimum to improve the processing speed.

Table 4.3 T Bit

| SH-2A/SH2A-FPU CPU | Description | Example for Other CPU |
|---------------------------|--|------------------------------|
| CMP/GE R1,R0 | T bit is set when $R0 \geq R1$. The program branches to TRGET0 when $R0 \geq R1$ and to TRGET1 when $R0 < R1$. | CMP.W R1,R0 |
| BT TRGET0 | | BGE TRGET0 |
| BF TRGET1 | | BLT TRGET1 |
| ADD #-1,R0 | T bit is not changed by ADD. T bit is set when $R0 = 0$. The program branches if $R0 = 0$. | SUB.W #1,R0 |
| CMP/EQ #0,R0 | | BEQ TRGET |
| BT TRGET | | |

(10) Immediate Data

Byte immediate data is located in instruction code. Word or longword immediate data is not input via instruction codes but is stored in a memory table. The memory table is accessed by an immediate data transfer instruction (MOV) using the PC relative addressing mode with displacement.

With the SH-2A/SH2A-FPU, immediate data of 17 to 28 bits can be located in an instruction code. However, for immediate data of 21 to 28 bits, an OR instruction must be executed after a register transfer.

Table 4.4 Referencing by Means of Immediate Data

| Type | SH-2A/SH2A-FPU CPU | | Example for Other CPU | |
|------------------|---------------------------|---------------|------------------------------|----------------|
| 8-bit immediate | MOV | #H'12,R0 | MOV.B | #H'12,R0 |
| 16-bit immediate | MOVI20 | #H'1234, R0 | MOV.W | #H'1234,R0 |
| 20-bit immediate | MOVI20 | #H'12345, R0 | MOV.L | #H'12345,R0 |
| 28-bit immediate | MOVI20S | #H'12345, R0 | MOV.L | #H'1234567,R0 |
| | OR | #H'67, R0 | | |
| 32-bit immediate | MOV.L | @(disp,PC),R0 | MOV.L | #H'12345678,R0 |
| | | | | |
| | .DATA.L | H'12345678 | | |

Note: Immediate data is referenced by @(disp,PC).

(11) Absolute Address

When data is accessed by absolute address, the value already in the absolute address is placed in the memory table. Loading the immediate data when the instruction is executed transfers that value to the register and the data is accessed in the indirect register addressing mode.

With the SH-2A/SH2A-FPU, when data is referenced using an absolute address not exceeding 28 bits, it is also possible to transfer immediate data located in the instruction code to a register, and reference the data using register indirect addressing mode. However, when referencing data using an absolute address of 21 to 28 bits, an OR instruction must be used after the register transfer.

Table 4.5 Referencing by Means of Absolute Address

| Type | SH-2A/SH2A-FPU CPU | Example for Other CPU |
|-----------------|--|-----------------------|
| Up to 20 bits | MOVI20 #H'12345, R1 MOV.B @R1, R0 | MOV.B @H'12345,R0 |
| 21 to 28 bits | MOVI20S #H'12345, R1 OR #H'67, R1 MOV.B @R1, R0 | MOV.B @H'1234567,R0 |
| 29 bits or more | MOV.L @(disp,PC),R1 MOV.B @R1,R0DATA.L H'12345678 | MOV.B @H'12345678,R0 |

(12) 16-Bit/32-Bit Displacement

When data is accessed by 16-bit or 32-bit displacement, the pre-existing displacement value is placed in the memory table. Loading the immediate data when the instruction is executed transfers that value to the register and the data is accessed in the indirect indexed register addressing mode.

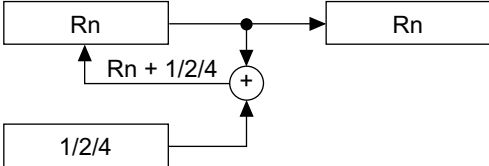

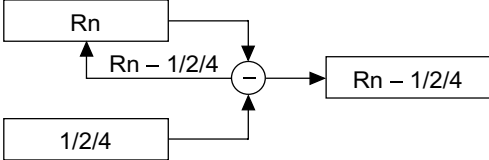

Table 4.6 Displacement Accessing

| Type | SH-2A/SH2A-FPU CPU | Example for Other CPU |
|---------------------|---|-----------------------|
| 16-bit displacement | MOV.W @(disp,PC),R0 MOV.W @(R0,R1),R2DATA.W H'1234 | MOV.W @(H'1234,R1),R2 |

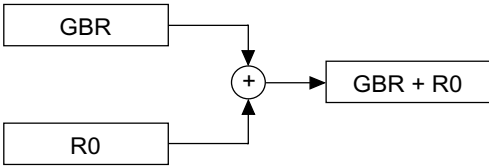

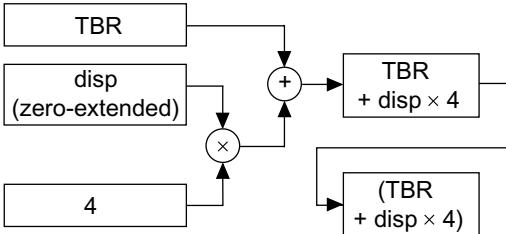

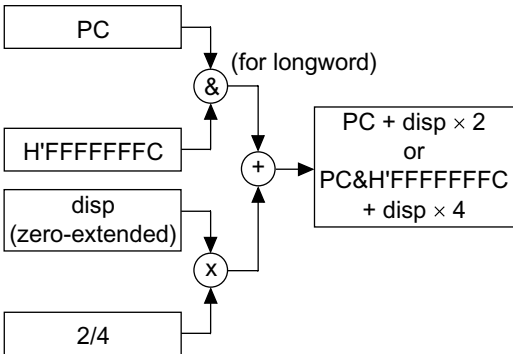

4.2 Addressing Modes

Addressing modes effective address calculation by the CPU core are described below.

Table 4.7 Addressing Modes and Effective Addresses

| Addressing Mode | Instruction Format | Effective Addresses Calculation | Formula |
|---|--------------------|---|---|
| Direct register addressing | Rn | The effective address is register Rn. (The operand is the contents of register Rn.) | — |
| Indirect register addressing | @Rn | The effective address is the content of register Rn.  | Rn |
| Post-increment indirect register addressing | @Rn + | The effective address is the content of register Rn. A constant is added to the content of Rn after the instruction is executed. 1 is added for a byte operation, 2 for a word operation, or 4 for a longword operation.  | Rn (After the instruction is executed) Byte: Rn + 1 → Rn Word: Rn + 2 → Rn Longword: Rn + 4 → Rn |
| Pre-decrement indirect register addressing | @-Rn | The effective address is the value obtained by subtracting a constant from Rn. 1 is subtracted for a byte operation, 2 for a word operation, or 4 for a longword operation.  | Byte: Rn - 1 → Rn Word: Rn - 2 → Rn Longword: Rn - 4 → Rn (Instruction executed with Rn after calculation) |

| Addressing Mode | Instruction Format | Effective Addresses Calculation | Formula |
|--|--------------------|--|--|
| Indirect register addressing with displacement | @(disp:4, Rn) | The effective address is Rn plus a 4-bit displacement (disp). The value of disp is zero-extended, and remains the same for a byte operation, is doubled for a word operation, or is quadrupled for a longword operation. | Byte: $Rn + disp$ Word: $Rn + disp \times 2$ Longword: $Rn + disp \times 4$ |
| | | | |
| | @(disp:12, Rn) | Effective address is register Rn contents with 12-bit displacement disp added. disp is zero-extended. | Byte: $Rn + disp$ Word: $Rn + disp$ Longword: $Rn + disp$ |
| | | | |
| Indirect indexed register addressing | @(R0, Rn) | The effective address is the Rn value plus R0. | $Rn + R0$ |
| | | | |
| Indirect GBR addressing with displacement | @(disp:8, GBR) | The effective address is the GBR value plus an 8-bit displacement (disp). The value of disp is zero-extended, and remains the same for a byte operation, is doubled for a word operation, or is quadrupled for a longword operation. | Byte: $GBR + disp$ Word: $GBR + disp \times 2$ Longword: $GBR + disp \times 4$ |
| | | | |

| Addressing Mode | Instruction Format | Effective Addresses Calculation | Formula |
|--|--------------------|---|---|
| Indirect indexed GBR addressing | @(R0, GBR) | The effective address is the GBR value plus R0.  | $GBR + R0$ |
| TBR duplicate indirect with displacement | @@(disp:8, TBR) | Effective address is register TBR contents with 8-bit displacement disp added. After disp is zero-extended, it is multiplied by 4.  | $(TBR + disp \times 4)$ |
| PC relative addressing with displacement | @(disp:8, PC) | The effective address is the PC value plus an 8-bit displacement (disp). The value of disp is zero-extended, and disp is doubled for a word operation, or is quadrupled for a longword operation. For a longword operation, the lowest two bits of the PC are masked.  | Word: $PC + disp \times 2$ Longword: $PC \& H'FFFFFFC + disp \times 4$ |

| Addressing Mode | Instruction Format | Effective Addresses Calculation | Formula |
|------------------------|--------------------|--|----------------------|
| PC relative addressing | disp:8 | The effective address is the PC value sign-extended with an 8-bit displacement (disp), doubled, and added to the PC. | $PC + disp \times 2$ |
| | | | |
| | disp:12 | The effective address is the PC value sign-extended with a 12-bit displacement (disp), doubled, and added to the PC. | $PC + disp \times 2$ |
| | | | |
| | Rn | The effective address is the register PC plus Rn. | $PC + Rn$ |
| | | | |
| Immediate addressing | #imm:20 | 20-bit immediate data imm of MOVI20 instruction is sign-extended. | — |
| | | | |
| | | 20-bit immediate data imm of MOVI20S instruction is left-shifted 8 bits, upper part is sign-extended, and lower part is zero-padded. | — |
| | | | |

| Addressing Mode | Instruction Format | Effective Addresses Calculation | Formula |
|----------------------|--------------------|--|---------|
| Immediate addressing | #imm:8 | The 8-bit immediate data (imm) for the TST, AND, OR, and XOR instructions are zero-extended. | — |
| | #imm:8 | The 8-bit immediate data (imm) for the MOV, ADD, and CMP/EQ instructions are sign-extended. | — |
| | #imm:8 | Immediate data (imm) for the TRAPA instruction is zero-extended and is quadrupled. | — |
| | #imm:3 | 3-bit immediate data imm of BAND, BOR, BXOR, BST, BLD, BSET, or BCLR instruction indicates bit position. | — |

4.3 Instruction Format

The instruction format table, table 5.8, refers to the source operand and the destination operand. The meaning of the operand depends on the instruction code. The symbols are used as follows:

- xxxx: Instruction code
- mmmm: Source register
- nnnn: Destination register
- iiii: Immediate data
- dddd: Displacement

Table 4.8 Instruction Formats

| Instruction Formats | Source Operand | Destination Operand | Example |
|---|---|---|-------------------|
| 0 format | — | — | NOP |
| <div style="border: 1px solid black; padding: 5px; width: fit-content;"> <div style="display: flex; justify-content: space-between; margin: 0 10px;">150</div> <div style="display: flex; justify-content: space-around; text-align: center;"> xxxx xxxx xxxx xxxx </div> </div> | | | |
| n format | — | nnnn: Register direct | MOV T Rn |
| <div style="border: 1px solid black; padding: 5px; width: fit-content;"> <div style="display: flex; justify-content: space-between; margin: 0 10px;">150</div> <div style="display: flex; justify-content: space-around; text-align: center;"> xxxx nnnn xxxx xxxx </div> </div> | Control register or system register | nnnn: Register direct | STS MACH,Rn |
| | R0 (register direct) | nnnn: Register direct | DIVU R0, Rn |
| | Control register or system register | nnnn: Register indirect with pre-decrement | STC.L SR,@-Rn |
| | mmmm: Register direct | R15 (register indirect with pre-decrement) | MOV MU.L Rm,@-R15 |
| | R15 (register indirect with post-increment) | nnnn: Register direct | MOV MU.L @R15+,Rn |
| | R0 (register direct) | nnnn: Register indirect with post-increment | MOV.L R0,@Rn+ |
| m format | mmmm: Register direct | Control register or system register | LDC Rm,SR |
| <div style="border: 1px solid black; padding: 5px; width: fit-content;"> <div style="display: flex; justify-content: space-between; margin: 0 10px;">150</div> <div style="display: flex; justify-content: space-around; text-align: center;"> xxxx mmmm xxxx xxxx </div> </div> | mmmm: Register indirect with post-increment | Control register or system register | LDC.L @Rm+,SR |
| | mmmm: Register indirect | — | JMP @Rm |
| | mmmm: Register indirect with pre-decrement | R0 (register direct) | MOV.L @-Rm, R0 |
| | mmmm: PC-relative using Rm | — | BRAF Rm |

| Instruction Formats | Source Operand | Destination Operand | Example |
|--|---|---|---------------------|
| nm format | mmmm: Direct register | nnnn: Direct register | ADD Rm,Rn |
| 15 <div style="border: 1px solid black; display: inline-block; padding: 2px;"> xxxx nnnn mmmm xxxx </div> 0 | mmmm: Direct register | nnnn: Indirect register | MOV.L Rm,@Rn |
| | mmmm: Indirect post-increment register (multiply/accumulate) | MACH, MACL | MAC.W @Rm+,@Rn+ |
| | nnnn*: Indirect post-increment register (multiply/accumulate) | | |
| | mmmm: Indirect post-increment register | nnnn: Direct register | MOV.L @Rm+,Rn |
| | mmmm: Direct register | nnnn: Indirect pre-decrement register | MOV.L Rm,@-Rn |
| | mmmm: Direct register | nnnn: Indirect indexed register | MOV.L Rm,@(R0,Rn) |
| md format | mmmmdddd: indirect register with displacement | R0 (Direct register) | MOV.B @(disp,Rm),R0 |
| 15 <div style="border: 1px solid black; display: inline-block; padding: 2px;"> xxxx xxxx mmmm dddd </div> 0 | | | |
| nd4 format | R0 (Direct register) | nnnndddd: Indirect register with displacement | MOV.B R0,@(disp,Rn) |

Note: * In multiply/accumulate instructions, nnnn is the source register.

Section 5 Instruction Set

5.1 Instruction Set by Classification

Table 5.1 shows instruction by classification.

Table 5.1 Classification of Instruction

| Classification | Instruction Type | Op Code | Function | Number of Instructions |
|----------------------------|------------------|---------|--|------------------------|
| Data transfer instructions | 13 | MOV | Data transfer Immediate data transfer Peripheral module data transfer Structure data transfer Reverse stack transfer | 62 |
| | | MOVA | Execution address transfer | |
| | | MOVI20 | 20-bit immediate data transfer | |
| | | MOVI20S | 20-bit immediate data transfer 8-bit left-shift | |
| | | MOVML | R0-Rn register save/restore | |
| | | MOVMU | Rn-R14, PR register save/restore | |
| | | MOVRT | T bit inversion and transfer to Rn | |
| | | MOVT | T bit transfer | |
| | | MOVU | Unsigned data transfer | |
| | | NOTT | T bit inversion | |
| | | PREF | Prefetch to operand cache | |
| | | SWAP | Upper/lower swap | |
| | | XTRCT | Extraction of middle of linked registers | |

| Classification | Instruction Type | Op Code | Function | Number of Instructions |
|-----------------------------------|------------------|----------|---|------------------------|
| Arithmetic operation instructions | 26 | ADD | Binary addition | 40 |
| | | ADDC | Binary addition with carry | |
| | | ADDV | Binary addition with overflow | |
| | | CMP/cond | Comparison | |
| | | CLIPS | Signed saturation value comparison | |
| | | CLIPU | Unsigned saturation value comparison | |
| | | DIVS | Signed division (32 ÷ 32) | |
| | | DIVU | Unsigned division (32 ÷ 32) | |
| | | DIV1 | 1-step division | |
| | | DIV0S | Signed 1-step division initialization | |
| | | DIV0U | Unsigned 1-step division initialization | |
| | | DMULS | Signed double-precision multiplication | |
| | | DMULU | Unsigned double-precision multiplication | |
| | | DT | Decrement and test | |
| | | EXTS | Sign extension | |
| | | EXTU | Zero extension | |
| | | MAC | Multiply and accumulate, double-precision multiply and accumulate | |
| | | MUL | Double-precision multiplication | |
| | | MULR | Rn result storage signed multiplication | |
| | | MULS | Signed multiplication | |
| | | MULU | Unsigned multiplication | |
| | | NEG | Sign inversion | |
| | | NEGC | Sign inversion with borrow | |
| | | SUB | Binary subtraction | |
| | | SUBC | Binary subtraction with borrow | |
| | | SUBV | Binary subtraction with underflow | |

| Classification | Instruction Type | Op Code | Function | Number of Instructions |
|------------------------------|---------------------------|---------|---------------------------------|------------------------|
| Logic operation instructions | 6 | AND | Logical AND | 14 |
| | | NOT | Bit inversion | |
| | | OR | Logical OR | |
| | | TAS | Memory test and bit setting | |
| | | TST | Logical AND T bit setting | |
| | | XOR | Exclusive logical OR | |
| Shift instructions | 12 | ROTL | 1-bit left rotation | 16 |
| | | ROTR | 1-bit right rotation | |
| | | ROTCL | 1-bit left rotation with T bit | |
| | | ROTCR | 1-bit right rotation with T bit | |
| | | SHAD | Dynamic arithmetic shift | |
| | | SHAL | Arithmetic 1-bit left shift | |
| | | SHAR | Arithmetic 1-bit right shift | |
| | | SHLD | Dynamic logical shift | |
| | | SHLL | Logical 1-bit left shift | |
| | | SHLLn | Logical n-bit left shift | |
| | | SHLR | Logical 1-bit right shift | |
| SHLRn | Logical n-bit right shift | | | |

| Classification | Instruction Type | Op Code | Function | Number of Instructions |
|-----------------------------|-------------------------|---------|--|------------------------|
| Branch instructions | 10 | BF | Conditional branch, delayed conditional branch (branches if T = 0) | 15 |
| | | BT | Conditional branch, delayed conditional branch (branches if T = 1) | |
| | | BRA | Unconditional delayed branch | |
| | | BRAF | Unconditional delayed branch | |
| | | BSR | Delayed branch to subroutine procedure | |
| | | BSRF | Delayed branch to subroutine procedure | |
| | | JMP | Unconditional delayed branch | |
| | | JSR | Branch to subroutine procedure, delayed branch to subroutine procedure | |
| | | RTS | Return from subroutine procedure, delayed return from subroutine procedure | |
| | | RTV/N | Return from subroutine procedure with Rm → R0 transfer | |
| System control instructions | 14 | CLRT | T bit clear | 36 |
| | | CLRMAC | MAC register clear | |
| | | LDBANK | Register restoration from specified register bank entry | |
| | | LDC | Load into control register | |
| | | LDS | Load into system register | |
| | | NOP | No operation | |
| | | RESBANK | Register restoration from register bank | |
| | | RTE | Return from exception handling | |
| | | SETT | T bit setting | |
| | | SLEEP | Transition to power-down state | |
| | | STBANK | Register save to specified register bank entry | |
| | | STC | Store from control register | |
| | | STS | Store from system register | |
| TRAPA | Trap exception handling | | | |

| Classification | Instruction Type | Op Code | Function | Number of Instructions |
|------------------------------|--|----------------|--|-------------------------------|
| Floating-point instructions | 19 | FABS | Floating-point absolute value | 48 |
| | | FADD | Floating-point addition | |
| | | FCMP | Floating-point comparison | |
| | | FCNVDS | Conversion from double-precision to single-precision | |
| | | FCNVSD | Conversion from single-precision to double-precision | |
| | | FDIV | Floating-point division | |
| | | FLDI0 | Floating-point load immediate 0 | |
| | | FLDI1 | Floating-point load immediate 1 | |
| | | FLDS | Floating-point load into system register FPUL | |
| | | FLOAT | Conversion from integer to floating-point | |
| | | FMAC | Floating-point multiply and accumulate operation | |
| | | FMOV | Floating-point data transfer | |
| | | FMUL | Floating-point multiplication | |
| | | FNEG | Floating-point sign inversion | |
| | | FSCHG | SZ bit inversion | |
| | | FSQRT | Floating-point square root | |
| | | FSTS | Floating-point store from system register FPUL | |
| FSUB | Floating-point subtraction | | | |
| FTRC | Floating-point conversion with rounding to integer | | | |
| FPU-related CPU instructions | 2 | LDS | Load into floating-point system register | 8 |
| | | STS | Store from floating-point system register | |

| Classification | Instruction Type | Op Code | Function | Number of Instructions |
|-------------------------------|-------------------------|----------------|------------------|-------------------------------|
| Bit manipulation instructions | 10 | BAND | Bit AND | 14 |
| | | BCLR | Bit clear | |
| | | BLD | Bit load | |
| | | BOR | Bit OR | |
| | | BSET | Bit setting | |
| | | BST | Bit store | |
| | | BXOR | Bit exclusive OR | |
| | | BANDNOT | Bit NOT AND | |
| | | BORNOT | Bit NOT OR | |
| | | BLDNOT | Bit NOT load | |
| Total 112 | | | 253 | |

Table 5.2 shows the format used in tables 5.3 to 5.8, which list instruction codes, operation, and execution states in order by classification.

Table 5.2 Instruction Code Format

| Item | Format | Explanation |
|------------------|---|---|
| Instruction | | Rm: Source register Rn: Destination register imm: Immediate data disp: Displacement ^{*1} |
| Instruction code | MSB ↔ LSB | m m m m: Source register n n n n: Destination register 0000: R0 0001: R1 . . . 1111: R15 i i i i: Immediate data d d d d: Displacement |
| Operation | →, ← (xx) M/Q/T & ^ ~ <<n >>n | Direction of transfer Memory operand Flag bits in the SR Logical AND of each bit Logical OR of each bit Exclusive OR of each bit Logical NOT of each bit n-bit left shift n-bit right shift |
| Execution cycles | — | Value when no wait states are inserted ^{*2} |
| T bit | — | Value of T bit after instruction is executed. An em-dash (—) in the column means no change. |

Notes: 1. Depending on the operand size, displacement is scaled $\times 1$, $\times 2$, or $\times 4$. For details, see section 5, Instruction Descriptions.

2. Instruction execution cycles: The execution cycles shown in the table are minimums. The actual number of cycles may be increased when (1) contention occurs between instruction fetches and data access, or (2) when the destination register of the load instruction (memory → register) and the register used by the next instruction are the same.

5.1.1 Data Transfer Instructions

Table 5.3 Data Transfer Instructions

| Instruction | Code | Operation | Cycles | T Bit | Compatibility | | |
|-----------------------|------------------|---|--------|-------|---------------|-----|----------------------------|
| | | | | | SH2E | SH4 | New SH-2A/ SH2A- FPU |
| MOV #imm, Rn | 1110nnnniiiiiiii | imm → sign extension → Rn | 1 | — | Yes | Yes | |
| MOV.W @(disp, PC), Rn | 1001nnnnddddddd | (disp×2+PC) → sign extension → Rn | 1 | — | Yes | Yes | |
| MOV.L @(disp, PC), Rn | 1101nnnnddddddd | (disp×4+PC) → Rn | 1 | — | Yes | Yes | |
| MOV Rm, Rn | 0110nnnnmmmm0011 | Rm → Rn | 1 | — | Yes | Yes | |
| MOV.B Rm, @Rn | 0010nnnnmmmm0000 | Rm → (Rn) | 1 | — | Yes | Yes | |
| MOV.W Rm, @Rn | 0010nnnnmmmm0001 | Rm → (Rn) | 1 | — | Yes | Yes | |
| MOV.L Rm, @Rn | 0010nnnnmmmm0010 | Rm → (Rn) | 1 | — | Yes | Yes | |
| MOV.B @Rm, Rn | 0110nnnnmmmm0000 | (Rm) → sign extension → Rn | 1 | — | Yes | Yes | |
| MOV.W @Rm, Rn | 0110nnnnmmmm0001 | (Rm) → sign extension → Rn | 1 | — | Yes | Yes | |
| MOV.L @Rm, Rn | 0110nnnnmmmm0010 | (Rm) → Rn | 1 | — | Yes | Yes | |

| STC.L VBR, @- Rn | 0100nnnn00100011 | Rn - 4 → Rn, VBR → (Rn) | 1 | — | Yes | Yes | |

| Instruction | Code | Operation | Cycles | T Bit | Compatibility | | |
|------------------|------------------|--|--------|-------|---------------|-----|--------------------|
| | | | | | SH2E | SH4 | New SH-2A/SH2A-FPU |
| STS MACH, Rn | 0000nnnn00001010 | MACH → Rn | 1 | — | Yes | Yes | |
| STS MACL, Rn | 0000nnnn00011010 | MACL → Rn | 1 | — | Yes | Yes | |
| STS PR, Rn | 0000nnnn00101010 | PR → Rn | 1 | — | Yes | Yes | |
| STS.L MACH, @-Rn | 0100nnnn00000010 | Rn - 4 → Rn, MACH → (Rn) | 1 | — | Yes | Yes | |
| STS.L MACL, @-Rn | 0100nnnn00010010 | Rn - 4 → Rn, MACL → (Rn) | 1 | — | Yes | Yes | |
| STS.L PR, @-Rn | 0100nnnn00100010 | Rn - 4 → Rn, PR → (Rn) | 1 | — | Yes | Yes | |
| TRAPA #imm | 11000011iiiiiiii | PC/SR → stack area, (imm × 4 + VBR) → PC | 5 | — | Yes | Yes | |

Notes: The execution cycles shown in the table are minimums. The actual number of cycles may be increased when (1) contention occurs between instruction fetches and data access, or (2) when the destination register of the load instruction (memory → register) and the register used by the next instruction are the same.

* In the event of bank overflow, the number of states is 19.

5.1.7 Floating-Point Instructions

Table 5.9 Floating-Point Instructions

| Instruction | Code | Operation | Cycles | T Bit | Compatibility | | |
|-----------------------|--------------------|-----------------------|--------|--------------------------------|---------------|-----|----------------------------|
| | | | | | SH2E | SH4 | New SH-2A/ SH2A- FPU |
| FABS FRn | 1111nnnn01011101 | FRn → FRn | 1 | — | Yes | Yes | |

Section 6 Instruction Descriptions

6.1 Overview of New Instructions

In the SH-2A/SH2A-FPU, new instructions have been added in vacant locations other than instruction codes assigned to SH-2E CPU instructions (instruction codes with upper 4 bits of 0000 to 1110) and SH4 FPU instructions (instruction codes with upper 4 bits of 1111). However, the SH-2A does not support the following SH4 FPU instructions: (a) FMOV instructions specifying XDm/XDn, (b) the FRCHG instruction, and (c) FIPR, and FTRV instructions.

This section gives detailed descriptions of the new instructions.

The new instructions are those described in (1) to (14) below. (1) to (3) are 32-bit fixed-length instructions, and (4) to (14) are 16-bit fixed-length instructions.

(1) Immediate Transfer Instructions

MOVI20, MOVI20S

These instructions transfer 20-bit immediate data in the instruction code to a register. Combination with one of these instructions simplifies generation of a 28-bit address, making it possible to specify on-chip memory addresses for a maximum of 256 MB.

(2) Structure Access Instructions

MOV.B/W/L Rm, @(disp12, Rn), MOV.B/W/L @(disp12, Rm), Rn
MOVU.B/W @(disp12, Rm), Rn
FMOV.S FRm, @(disp12, Rn), FMOV.S @(disp12, Rm), FRn
FMOV.D DRm, @(disp12, Rn), FMOV.D @(disp12, Rm), DRn

These instructions reference memory by specifying a 12-bit displacement located in the instruction code. An MOVU unsigned load instruction that automatically performs execution of zero extension has also been added.

(3) Bit Manipulation Instructions (Operating on Memory)

BAND.B #imm3, @(disp12, Rn), BOR.B #imm3, @(disp12, Rn)
BCLR.B #imm3, @(disp12, Rn), BSET.B #imm3, @(disp12, Rn)
BST.B #imm3, @(disp12, Rn), BLD.B #imm3, @(disp12, Rn)
BXOR.B #imm3, @(disp12, Rn)
BANDNOT.B #imm3, @(disp12, Rn), BORNOT.B #imm3, @(disp12, Rn)
BLDNOT.B #imm3, @(disp12, Rn)

The BAND.B, BOR.B, and BXOR.B instructions perform logical operations between a bit in memory and the T bit, and store the result in the T bit. The BCLR.B and BSET.B instructions manipulate a bit in memory. The BST.B and BLD.B instructions execute a transfer between a bit in memory and the T bit. The BANDNOT.B and BORNOT.B instructions perform logical operations between the value resulting from inverting a bit in memory and the T bit, and store the result in the T bit. The BLDNOT.B instruction inverts a bit in memory and stores the result in the T bit. Bits other than the specified bit are not affected.

(4) Bit Manipulation Instructions (Operating on a General Register)

BCLR #imm3, Rn, BSET #imm3, Rn
BST #imm3, Rn, BLD #imm3, Rn

The BCLR and BSET instructions manipulate one of the LSB 8 bits of a general register Rn. The BST and BLD instructions execute a transfer between one of the LSB 8 bits of a general register Rn and the T bit. Bits other than the specified bit are not affected.

(5) Multiplication Result Rn Storage Instruction

MULR

MULR performs a 32-bit x 32-bit multiplication, and stores the lower 32 bits of the result in a general register Rn.

(6) Batch Division Instructions

DIVS, DIVU

These instructions perform batch 32-bit ÷ 32-bit division. The DIVU instruction performs division of unsigned data, and the DIVS instruction performs division of signed data.

(7) Saturation Value Comparison Instructions

CLIPS, CLIPU

These instructions perform a comparison with a saturation value, and store the saturation upper-limit value in a general register Rn if the general register Rn contents exceed the saturation upper-limit value, or store the saturation lower-limit value in general register Rn if the general register Rn contents are less than the saturation upper-limit value. Only byte and word saturation values are supported.

(8) Barrel Shift Instructions

SHAD, SHLD

These instructions shift arbitrary bits. Two kinds of instructions are provided, for an arithmetic shift and a logical shift.

(9) Multiple Register Save/Restore Instructions

MOVML, MOVMU

These instructions save a number of consecutive registers to memory, or restore a number of consecutive registers from memory. It is possible to specify a general register Rn, and to save or restore consecutive general registers higher than or lower than the specified Rn.

(10) T Bit Inversion and Transfer Instructions

MOVRT, NOTT

These instructions invert the T bit and transfer the resulting value to a general register Rn or the T bit.

(11) Register Bank Related Instructions

RESBANK, STBANK, LDBANK

These are register bank related instructions that are provided in order to speed up interrupt handling.

(12) Reverse Stack Transfer Instructions

MOV.B/W/L

These are transfer instructions in which the stack expansion direction is reversed.

(13) Unconditional Branch Instructions with No Delay Slot

JSR/N, RTS/N

Instructions that do not have a delay slot are provided in order to reduce the code size by cutting down on the number of unnecessary NOP instructions.

(14) Cache-Related Instruction

PREF

An SH3-DSP cache-related instruction is provided.

6.2 Format of Instruction Descriptions

Format of this Section: The format used for describing instructions is as shown below.

| Instruction Name Instruction Function | Instruction Function (Explanation of Instruction Name) | Instruction Type Instruction Set Compatibility | | |
|--|---|---|-------------------------------------|--|
| Format | Abstract | Code | Cycles | T Bit |
| Shown in assembler input format. imm and disp are numeric values, expressions, or symbols. | Summarizes the operation. | Shown in MSB ↔ LSB order. | Value in case of no-wait operation. | Shows the value of the T bit after execution of the instruction. |

Description

Describes the operation of the instruction.

Notes

Mentions points requiring particular attention when using the instruction.

Operation

Shows the operation of the instruction in C. Provided as a reference to explain the operation of the instruction. The use of the following resources is assumed here.

```
unsigned char    Read_Byte (unsigned long Addr);
unsigned short  Read_Word  (unsigned long Addr);
unsigned int     Read_Int   (unsigned long Addr);
unsigned long   Read_Long  (unsigned long Addr);
unsigned double Read_Quad  (unsigned long Addr);
```

The size of address Addr is returned. A word read from other than a 2n address or a longword read from other than a 4n address will be detected as an address error.

```
unsigned long    Read_Bank_Long (unsigned long Addr);
```

The contents of the register bank entry indicated by the contents of address Addr are returned.

```
unsigned char    Write_Byte (unsigned long Addr, unsigned long Data);
unsigned short   Write_Word (unsigned long Addr, unsigned long Data);
unsigned int     Write_Int  (unsigned long Addr, unsigned long Data);
unsigned long    Write_Long (unsigned long Addr, unsigned long Data);
unsigned double  Write_Quad (unsigned long Addr, unsigned long Data);
```

Data Data is written to address Addr using the respective size. A word write to other than a 2n address or a longword write to other than a 4n address will be detected as an address error.

```
unsigned long    Write_Bank_Long (unsigned long Addr, unsigned long
Data);
```

Data Data is written to the register bank entry indicated by the contents of address Addr.

```
unsigned long    R[16];
unsigned long    SR, GBR, VBR, TBR;
unsigned long    MACH, MACL, PR;
unsigned long    PC;
```

Respective registers

```
struct BANK {
    unsigned long    Rn_BANK[15];
    unsigned long    GBR_BANK;
    unsigned long    MACH_BANK;
    unsigned long    MACL_BANK;
    unsigned long    PR_BANK;
    unsigned long    IVN;
};
```

```
BANK Register_Bank[512];
```

Register bank structure definition

(VTO: Interrupt vector table address offset)

```
struct SR0 {
    unsigned long    dummy0:17;
    unsigned long    BO0:1;
    unsigned long    CS0:1;
    unsigned long    dummy1:3;
    unsigned long    M0:1;
    unsigned long    Q0:1;
    unsigned long    I0:4;
```

```

    unsigned long  dummy2:2;
    unsigned long  S0:1;
    unsigned long  T0:1;
} ;

```

SR structure definition

```

#define BO ((* (struct SR0 *) (&SR)).BO0)
#define CS ((* (struct SR0 *) (&SR)).CS0)
#define M  ((* (struct SR0 *) (&SR)).M0)
#define Q  ((* (struct SR0 *) (&SR)).Q0)
#define I  ((* (struct SR0 *) (&SR)).I0)
#define S  ((* (struct SR0 *) (&SR)).S0)
#define T  ((* (struct SR0 *) (&SR)).T0)

```

Definition of bits in SR

```
Error (char *er);
```

Error indication function

These are floating-point number definition statements.

```

Example

An example is shown using assembler mnemonics, indicating the states before and after execution of the instruction.

Italics (e.g., *.align*) indicate an assembler control instruction. The meaning of the assembler control instructions is given below. For details, refer to the Cross-Assembler User's Manual.

| | |
|--------------------|--|
| <i>.org</i> | Location counter setting |
| <i>.data.w</i> | Word integer data allocation |
| <i>.data.l</i> | Longword integer data allocation |
| <i>.sdata</i> | String data allocation |
| <i>.align 2</i> | 2-byte boundary alignment |
| <i>.align 4</i> | 4-byte boundary alignment |
| <i>.align 32</i> | 32-byte boundary alignment |
| <i>.arepeat 16</i> | 16-times repeat expansion |
| <i>.arepeat 32</i> | 32-times repeat expansion |
| <i>.aendr</i> | Count-specification repeat expansion end |

Note: SH Series cross-assembler version 1.0 does not support conditional assembler functions.

6.3 New Instructions

| | | |
|-------------------|----------------|-------------------------------------|
| 6.3.1 BAND | Bit AND | Bit Manipulation Instruction |
| Bit Logical AND | | SH-2A/SH2A-FPU (New) |

| Format | Abstract | Code | Cycle | T Bit |
|----------------------------|---------------------------------|---------------------------------|-------|---------------------|
| BAND.B #imm3, @(disp12,Rn) | (<imm> of (disp+Rn)) & T → T | 0011nnnn0iii10010100ddddddddddd | 3 | Operation result |

Description

ANDs a specified bit in memory at the address indicated by (disp + Rn) with the T bit, and stores the result in the T bit. The bit number is specified by 3-bit immediate data. With this instruction, data is read from memory as a byte unit.

BAND.B #imm3, @(disp12, Rn)

Operation

```

BANDM (long d, long i, long n) /*BAND.B #imm3, @(disp12, Rn) */
{
    long disp, imm, temp, assignbit;

    disp = (0x00000FFF & (long)d);
    imm= (0x00000007&(long)i);
    temp= (long) Read_Byte (R[n]+disp);
    assignbit = (0x00000001<<imm)&temp;
    if((T==0) || (assignbit==0)) T=0;
    else T=1;
    PC+=4;
}

```

Examples:

```

BAND.B #H'5, @(2, R0) ; Before execution: @(R0 + 2) = H'DF, T=1
                    ; After execution:  @(R0 + 2) = H'DF, T=0

```

6.3.2 BANDNOT Bit ANDNOT Bit Manipulation Instruction

Bit NOT Logical AND SH-2A/SH2A-FPU (New)

| Format | Abstract | Code | Cycle | T Bit |
|-------------------------------|----------------------------------|----------------------------------|-------|------------------|
| BANDNOT.B #imm3, @(disp12,Rn) | ~(<imm> of (disp+Rn)) & T → T | 0011nnnn0iiii10011100ddddddddddd | 3 | Operation result |

Description

ANDs the value obtained by inverting a specified bit of memory at the address indicated by (disp + Rn) with the T bit, and stores the result in the T bit. The bit number is specified by 3-bit immediate data. With this instruction, data is read from memory as a byte unit.

BANDNOT.B #imm3, @(disp12, Rn)

Operation

```

BANDNOTM (long d, long i, long n) /*BANDNOT.B #imm3, @(disp12, Rn) */
{
    long disp, imm, temp, assignbit;

    disp = (0x00000FFF & (long)d);
    imm= (0x00000007&(long)i);
    temp= (long) Read_Byte (R[n]+disp);
    assignbit = (0x00000001<<imm)&temp;
    if ((T==1)&&(assignbit==0)) T=1;
    else T=0;
    PC+=4;
}

```

Examples:

BANDNOT.B #H'5, @(2, R0) ; Before execution: @(R0 + 2) = H'20, T = 1
; After execution: @(R0 + 2) = H'20, T = 0

6.3.3 BCLR Bit Clear

Bit CLear **Bit Manipulation Instruction**
SH-2A/SH2A-FPU (New)

| Format | Abstract | Code | Cycle | T Bit |
|----------------------------|--------------------------|--------------------------------|-------|-------|
| BCLR.B #imm3, @(disp12,Rn) | 0 → (<imm> of (disp+Rn)) | 0011nnnn0iii10010000dddddddddd | 3 | — |
| BCLR #imm3, Rn | 0 → <imm> of Rn | 10000110nnnn0iii | 1 | — |

Description

Clears a specified bit of memory at the address indicated by (disp + Rn), or of the LSB 8 bits of a general register Rn. The bit number is specified by 3-bit immediate data. With the BCLR.B instruction, after data is read from memory as a byte unit, clearing of the specified bit is executed, and the resulting data is then written to memory as a byte unit.

BCLR.B #imm3, @(disp12, Rn)

BCLR #imm3, Rn

Operation

```

BCLRM (long d, long i, long n) /*BCLR.B #imm3, @(disp12, Rn) */
{
    long disp, imm, temp;

    disp = (0x00000FFF & (long)d);
    imm= (0x00000007&(long)i);
    temp= (long) Read_Byte (R[n]+disp);
    temp&=(~(0x00000001<<imm));
    Write_Byte (R[n]+disp, temp);
    PC+=4;
}

BCLR (long i, long n) /*BCLR #imm3, Rn */
{
    long imm, temp;

    imm= (0x00000007 &(long)i);
    R[n]&=(~(0x00000001<<imm));
    PC+=2;
}

```

Examples:

```

BCLR.B #H'5, @(2, R0) ; Before execution: @(R0 + 2) = H'FF
                      ; After execution:  @(R0 + 2) = H'DF

BCLR #H'4, R0        ; Before execution: @R0 = H'FFFFFFFF
                      ; After execution:  @R0 = H'FFFFFFFF

```

6.3.4 BLD Bit Load Bit Manipulation Instruction SH-2A/SH2A-FPU (New)

| Format | Abstract | Code | Cycle | T Bit |
|---------------------------|------------------------|------------------------------------|-------|------------------|
| BLD.B #imm3, @(disp12,Rn) | <imm> of (disp+Rn) → T | 0011nnnn0iiii10010011ddddddddddddd | 3 | Operation result |
| BLD #imm3, Rn | <imm> of Rn → T | 10000111nnnnliiii | 1 | Operation result |

Description

Stores a specified bit of memory at the address indicated by (disp + Rn), or of the LSB 8 bits of a general register Rn, in the T bit. The bit number is specified by 3-bit immediate data. With the BLD.B instruction, data is read from memory as a byte unit.

BLD.B #imm3, @(disp12, Rn)

BLD #imm3, Rn

Operation

```

BLDM (long d, long i, long n) /*BLD.B #imm3, @(disp12, Rn) */
{
    long disp, imm, temp, assignbit;

    disp = (0x00000FFF & (long)d);
    imm = (0x00000007 & (long)i);
    temp = (long) Read_Byte (R[n]+disp);
    assignbit = (0x00000001 << imm) & temp;
    if (assignbit == 0) T = 0;
    else T = 1;
    PC += 4;
}

BLD (long i, long n) /*BLD #imm3, Rn */
{
    long imm, assignbit;

    imm = (0x00000007 & (long)i);
    assignbit = (0x00000001 << imm) & R[n];
    if (assignbit == 0) T = 0;
    else T = 1;
    PC += 2;
}

```

Examples:

```

BLD.B #H'5, @(2, R0) ; Before execution: @(R0 + 2) = H'20, T = 0
                    ; After execution:  @(R0 + 2) = H'20, T = 1

BLD #H'4, R0        ; Before execution: R0 = H'000000EF, T = 1
                    ; After execution:  R0 = H'000000EF, T = 0

```

| BLDNOT.B #imm3, @(disp12,Rn) | ~(<imm> of (disp+Rn)) → T | 0011nnnn0iii10011011ddddddddddddd | 3 | Operation result |

Description

Inverts a specified bit of memory at the address indicated by (disp + Rn), and stores the resulting value in the T bit. The bit number is specified by 3-bit immediate data. With the BLDNOT.B instruction, data is read from memory as a byte unit.

BLDNOT.B #imm3, @(disp12, Rn)

Operation

```
BLDNOTM (long d, long i, long n) /*BLDNOT.B #imm3, @(disp12, Rn) */
{
    long disp, imm, temp, assignbit;

    disp = (0x00000FFF & (long)d);
    imm = (0x00000007 & (long)i);
    temp = (long) Read_Byte (R[n]+disp);
    assignbit = (0x00000001 << imm) & temp;
    if (assignbit == 0) T = 1;
    else T = 0;
    PC += 4;
}
```

Examples:

BLDNOT.B #H'5, @(2, R0) ; Before execution: @ (R0 + 2) = H'20, T = 1
; After execution: @ (R0 + 2) = H'20, T = 0

| BOR.B #imm3, @(disp12,Rn) | (<imm> of (disp+Rn)) T → T | 0011nnnn0iii10010101dddddddddd | 3 | Operation result |

Description

ORs a specified bit in memory at the address indicated by (disp + Rn) with the T bit, and stores the result in the T bit. The bit number is specified by 3-bit immediate data. With this instruction, data is read from memory as a byte unit.

BOR.B #imm3, @(disp12, Rn)

Operation

```

BORM (long d, long i, long n) /*BOR.B #imm3, @(disp12, Rn) */
{
    long disp, imm, temp, assignbit;

    disp = (0x00000FFF & (long)d);
    imm= (0x00000007&(long)i);
    temp= (long) Read_Byte (R[n]+disp);

    if((T==0)&&(assignbit==0)) T=0;
    else T=1;

    PC+=4;
}

```

Examples:

```

BOR.B #H'5@, (2,R0) ; Before execution: @(R0,2) = H'20, T = 0
                   ; After execution:  @(R0,2) = H'20, T = 1

```

6.3.7 BORNOT Bit ORNOT

Bit NOT Logical OR

Bit Manipulation Instruction

SH-2A/SH2A-FPU (New)

| Format | Abstract | Code | Cycle | T Bit |
|------------------------------|--|--------------------------------|-------|------------------|
| BORNOT.B #imm3, @(disp12,Rn) | $\sim(\langle imm \rangle \text{ of } (disp+Rn)) \mid T \rightarrow T$ | 0011nnnn0iii10011101dddddddddd | 3 | Operation result |

Description

ORs the value obtained by inverting a specified bit of memory at the address indicated by (disp + Rn) with the T bit, and stores the result in the T bit. The bit number is specified by 3-bit immediate data. With this instruction, data is read from memory as a byte unit.

BORNOT.B #imm3, @(disp12, Rn)

Operation

```

BORNOTM (long d, long i, long n) /*BORNOT.B #imm3, @(disp12, Rn) */
{
    long disp, imm, temp, assignbit;

    disp = (0x00000FFF & (long)d);

    if((T==1) || (assignbit==0)) T=1;
    else T=0;

    PC+=4;
}

```

Examples:

```

BORNOT.B #H'5, @(2, R0) ; Before execution: @(R0 + 2) = H'DF, T = 0
                        ; After execution:  @(R0 + 2) = H'DF, T = 1

```

6.3.8 BSET Bit SET Bit Manipulation Instruction SH-2A/SH2A-FPU (New)

| Format | Abstract | Code | Cycle | T Bit |
|----------------------------|--------------------------|---------------------------------|-------|-------|
| BSET.B #imm3, @(disp12,Rn) | 1 → (<imm> of (disp+Rn)) | 0011nnnn0iii10010001ddddddddddd | 3 | — |
| BSET #imm3, Rn | 1 → <imm> of Rn | 10000110nnnn1iii | 1 | — |

Description

Sets to 1 a specified bit of memory at the address indicated by (disp + Rn), or of the LSB 8 bits of a general register Rn. The bit number is specified by 3-bit immediate data. With the BSET.B instruction, after data is read from memory as a byte unit, the specified bit is set to 1, and the resulting data is then written to memory as a byte unit.

BSET.B #imm3, @(disp12, Rn)

BSET #imm3, Rn

Operation

```

BSETM (long d, long i, long n) /*BSET.B #imm3, @(disp12, Rn) */
{
    long disp, imm, temp;

    disp = (0x00000FFF & (long)d);
    imm= (0x00000007&(long)i);
    temp= (long) Read_Byte (R[n]+disp);
    temp|=(0x00000001<<imm);
    Write_Byte (R[n]+disp, temp);
    PC+=4;
}

```

```

BSET (long i, long n) /*BSET #imm3, Rn */
{

    imm= (0x00000007 & (long)i);
    R[n]|=(0x00000001<<imm);
    PC+=2;
}

```

Examples:

```

BSET.B #H'5, @(2, R0) ; Before execution: @(R0 + 2) = H'00
                      ; After execution:  @(R0 + 2) = H'20

BSET #H'4, R0        ; Before execution: R0 = H'00000000
                      ; After execution:  R0 = H'00000010

```

6.3.9 BST Bit Store Bit Manipulation Instruction SH-2A/SH2A-FPU (New)

| Format | Abstract | Code | Cycle | T Bit |
|---------------------------|--------------------------|---------------------------------|-------|-------|
| BST.B #imm3, @(disp12,Rn) | T → (<imm> of (disp+Rn)) | 0011nnnn0iii10010010ddddddddddd | 3 | — |
| BST #imm3, Rn | T → <imm> of Rn | 10000111nnnn0iii | 1 | — |

Description

Transfers the contents of the T bit to a specified 1-bit location of memory at the address indicated by (disp + Rn), or of the LSB 8 bits of a general register Rn. The bit number is specified by 3-bit immediate data. With the BST.B instruction, after data is read from memory as a byte unit, transfer from the T bit to the specified bit is executed, and the resulting data is then written to memory as a byte unit.

BST.B #imm3, @(disp12, Rn)

BST #imm3, Rn

Operation

```

BSTM (long d, long i, long n) /*BST.B #imm3, @(disp12, Rn) */
{
    long disp, imm, temp;

    disp = (0x00000FFF & (long)d);
    imm= (0x00000007&(long)i);
    temp = (long) Read_Byte (R[n]+disp);
    if (T==0) temp&=(~(0x00000001<<imm));
    else temp|=(0x00000001<<imm);
    Write_Byte (R[n]+disp, temp);

    PC+=4;
}

```

```

BST (long i, long n) /*BST #imm3, Rn */
{

|---------------|---|-----------------------|---|
| 6.3.11 | CLIPS Signed Saturation Value Compare Instruction | CLIP as Signed | Arithmetic Instruction SH-2A/SH2A-FPU (New) |
|---------------|---|-----------------------|---|

| No. | Format | Abstract | Code | Cycle | T Bit |
|-----|------------|---|-------------------|-------|-------|
| 1 | CLIPS.B Rn | If Rn > (saturation upper-limit value), (saturation upper-limit value) → Rn, 1 → CS | 0100nnnnn10010001 | 1 | — |
| 2 | CLIPS.W Rn | If Rn < (saturation lower-limit value), (saturation lower-limit value) → Rn, 1 → CS | 0100nnnnn10010101 | 1 | — |

Description

Determines saturation. Signed data is used with this instruction. The saturation upper-limit value is stored in general register Rn if the contents of Rn exceed the saturation upper-limit value, or the saturation lower-limit value is stored in Rn if the contents of Rn are less than the saturation lower-limit value, and the CS bit is set to 1. The saturation upper-limit value and lower-limit value for each instruction are shown in the table below.

| No. | Instruction | Saturation Lower-Limit Value | Saturation Upper-Limit Value |
|-----|-------------|------------------------------|------------------------------|
| 1 | CLIPS.B Rn | H'FFFFFF80 | H'0000007F |
| 2 | CLIPS.W Rn | H'FFFF8000 | H'00007FFF |

Notes

The CS bit value does not change if the contents of general register Rn do not exceed the saturation upper-limit value or are not less than the saturation lower-limit value.

Operation

```
CLIPSB(long n) /* CLIPS.B Rn*/
{
  if ( R[n] > 0x0000007F)
  {
    R[n]=0x0000007F;
    CS=1;
  }
  else if (R[n] < 0xFFFFF80)
  {
    R[n]=0xFFFFF80;
    CS=1;
  }
  PC+2;
}
```

```
CLIPSW(long n) /* CLIPS.W Rn*/
{
  if ( R[n] > 0x00007FFF)
  {
    R[n]=0x00007FFF;
    CS=1;
  }
  else if (R[n] < 0xFFFF8000)
  {
    R[n]=0xFFFF8000;
    CS=1;
  }
  PC+2;
}
```

Examples:

CLIPS.B R0 ; Before execution: R0 = H'0000000F, CS = 0
; After execution: R0 = H'0000000F, CS = 0

CLIPS.B R1 ; Before execution: R1 = H'00000080, CS = 0
; After execution: R1 = H'0000007E, CS = 1

CLIPS.W R0 ; Before execution: R0 = H'FFFFFFFF0, CS = 0
; After execution: R0 = H'FFFFFFFF0, CS = 0

CLIPS.W R1 ; Before execution: R1 = H'FFFF7000, CS = 0
; After execution: R1 = H'FFFF8000, CS = 1

| 6.3.13 DIVS Signed Division | DIVide as Signed | Arithmetic Instruction SH-2A/SH2A-FPU (New) |
|---------------------------------------|-------------------------|---|

| Format | Abstract | Code | Cycle | T Bit |
|------------|-------------------------------------|------------------|-------|-------|
| DIVS R0,Rn | Signed, $Rn \div R0 \rightarrow Rn$ | 0100nnnn10010100 | 36 | — |

Description

Executes division of the 32-bit contents of a general register Rn (dividend) by the contents of R0 (divisor). This instruction executes signed division and finds the quotient only. A remainder operation is not provided. To obtain the remainder, find the product of the divisor and the obtained quotient, and subtract this value from the dividend. The sign of the remainder will be the same as that of the dividend.

Notes

An overflow exception will occur if the negative maximum value (H'00000000) is divided by -1. If division by zero is performed a division by zero exception will occur.

If an interrupt is generated while this instruction is being executed, execution will be halted. The return address will be the start address of this instruction, and this instruction will be re-executed.

Operation

```
DIVS (long n) /* DIVS R0, Rn */
{
    R[n]=R[n] / R[0];
    PC+=2;
}
```

Examples:

```
DIVS R0,R1 ; R1(32bits) / R0 (32bits) = R1(32bits); signed
```

| | | | |
|---------------|----------------------------------|---------------------------|---|

| Format | Abstract | Code | Cycle | T Bit |
|-------------|------------------------|------------------|-------|-------|
| DIVU R0, Rn | Unsigned, Rn + R0 → Rn | 0100nnnn10000100 | 34 | — |

Description

Executes division of the 32-bit contents of a general register Rn (dividend) by the contents of R0 (divisor). This instruction executes unsigned division and finds the quotient only. A remainder operation is not provided. To obtain the remainder, find the product of the divisor and the obtained quotient, and subtract this value from the dividend.

Notes

A division by zero exception will occur if division by zero is performed.

If an interrupt is generated while this instruction is being executed, execution will be halted. The return address will be the start address of this instruction, and this instruction will be re-executed.

Operation

```
DIVU (long n) /* DIVU R0, Rn */
{
    (unsigned long) R[n]= (unsigned long)R[n] /
    (unsigned long )R[0];
    PC+=2;
}
```

Examples:

```
DIVU R0,R1 ; R1(32bits) / R0(32bits) = R1(32bits); unsigned
```

6.3.15 FMOV Floating-point MOVE Floating-Point Instruction

Floating-Point Transfer SH-2A/SH2A-FPU (New)

| No. | SZ | Format | Abstract | Code | Cycle | T Bit |
|-----|----|--------------------------|-------------------|----------------------------------|-------|-------|
| 1 | 0 | FMOV.S FRm, @(disp12,Rn) | FRm → (disp×4+Rn) | 0011nnnnmmmm00010011ddddddddddd | 1 | — |
| 2 | 1 | FMOV.D DRm, @(disp12,Rn) | DRm → (disp×8+Rn) | 0011nnnnmmmm000010011ddddddddddd | 2 | — |

| JSR/N @Rm | PC - 2 → PR, Rm → PC | 0100mmmm01001011 | 3 | — |
| JSR/N @@(disp8, TBR) | PC - 2 → PR, (disp×4+TBR) → PC | 10000011ddddddd | 5 | — |

Description

Branches to a subroutine procedure at the designated address. The contents of PC are stored in PR and execution branches to the address indicated by the contents of general register Rm as 32-bit data or to the address read from memory address ($\text{disp} \times 4 + \text{TBR}$). The stored contents of PC indicate the starting address of the second instruction after the present instruction. This instruction is used with RTS as a subroutine procedure call.

Notes

This is not a delayed branch instruction.

For the Renesas Technology Super H RISC engine assembler, declarations should use scaled values ($\times 4$) as displacement values.

Operation

```
JSRN (long m) /* JSR/N @Rm, */
```

```
{  
    unsigned long temp;  
  
    temp=PC;  
    PR=PC-2;  
    PC=R[m]+4;  
}
```

```
JSRNM (long d) /* JSR/N @@(disp8, TBR) */
```

```
{  
    unsigned long temp;  
    long disp;  
  
    temp=PC;  
    PR=PC-2;  
    disp=(0x000000FF & d);  
    PC=Read_Long(TBR+(disp<<2))+4;  
}
```

Examples:

```

6.3.17 LDBANK Load register BANK

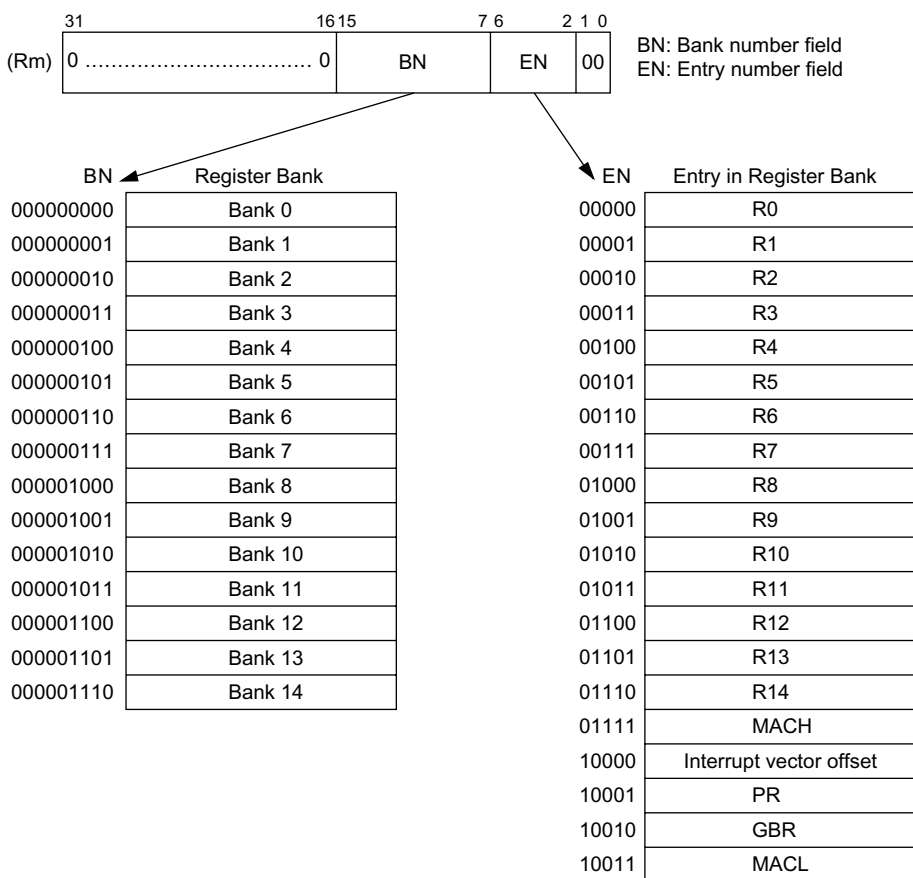

Transfer to Specified Register Bank Entry

System Control Instruction
SH-2A/SH2A-FPU (New)

| Format | Abstract | Code | Cycle | T Bit |
|----------------|--------------------------------------|------------------|-------|-------|
| LDBANK @Rm, R0 | (Specified register bank entry) → R0 | 0100mmmm11100101 | 6 | — |

Description

The register bank entry indicated by the contents of general register Rm is transferred to general register R0. The register bank number and register stored in the bank are specified by general register Rm.

Note

The architecture supports a maximum of 512 banks. However, the number of banks differs depending on the product.

Operation

```
LDBANK (long m) /*LDBANK @Rm, R0 */
{
  R[0]=Read_Bank_Long(R[m]);
  PC+=2;
}
```

Examples:

```
LDBANK @R1,R0 ; Before execution: R1 = H'00000108
                ; After execution: R0 = Contents of R2 stored in R0 = bank 2
```

| 6.3.18 | LDC | Load to Control register | System Control Instruction |
| | Load to Control Register | | SH-2A/SH2A-FPU (New) |

| Format | Abstract | Code | Cycle | T Bit |
|-------------|----------|------------------|-------|-------|
| LDC Rm, TBR | Rm → TBR | 0100mmmm01001010 | 1 | — |

Description

Stores a source operand in control register TBR.

Operation

```
LDCTBR (long m) /* LDC Rm, TBR*/
{
    TBR=R[m];
    PC+=2;
}
```

Examples:

```
LDC R0, TBR ; Before execution: R0 = H'12345678, TBR = H'00000000
; After execution: TBR = H'12345678
```

| MOV.L @(disp12,Rm), Rn | (disp×4+Rm) → Rn | 0011nnnnmmmm00010110ddddddddddd | 1 | — |

Description

Transfers a source operand to a destination. This instruction is ideal for data access in a structure or the stack.

Note

For the Renesas Technology Super H RISC engine assembler, declarations should use scaled values (×1, ×2, ×4) as displacement values.

Operation

```
MOVBS12 (long d, long m, long n) /* MOV.B Rm, @(disp12,Rn) */
{
    long disp;

    disp = (0x0000FFF & (long)d);
    Write_Byte(R[n]+disp,R[m]);
    PC+=4;
}

MOVWS12 (long d, long m, long n) /* MOV.W Rm, @(disp12,Rn) */
{
    long disp;

    disp = (0x0000FFF & (long)d);
```

```
Write_Word(R[n]+(disp<<1),R[m]);
PC+=4;
}

MOVLS12 (long d, long m, long n) /* MOV.L Rm, @(disp12,Rn) */
{
    long disp;

    disp = (0x00000FFF & (long)d);
    Write_Long(R[n]+(disp<<2), R[m]);
    PC+=4;
}

MOVBL12 (long d, long m, long n) /* MOV.B @(disp12,Rm), Rn */
{
    long disp;

    disp = (0x00000FFF & (long)d);
    R[n]=Read_Byte(R[m]+disp);
    if ( ( R[n]&0x80 ) ==0) R[n] &=0x000000FF;
    else R[0] |=0xFFFFFFFF00;
    PC+=4;
}

MOVWL12 (long d, long m, long n) /* MOV.W @(disp12,Rm), Rn */
{
    long disp;

    disp = (0x00000FFF & (long)d);
    R[n]=Read_Word(R[m]+(disp<<1));
    if ((R[n]&0x8000) ==0) R[n] &=0x0000FFFF;
    else R[n] |=0xFFFF0000;
    PC+=4;
}
```

```
MOVLL12 (long d, long m, long n) /* MOV.L @(disp12,Rm), Rn */
{
    long disp;

    disp = (0x00000FFF & (long)d);
    R[n]=Read_Long(R[m]+(disp<<2));
    PC+=4;
}
```

Examples:

```
MOV.B R0,@(1,R1) ; Before execution: R0 = H'FFFF7F80
                  ; After execution: @(R1 + 1) = H'80
```

```
MOV.L @(2,R0),R1 ; Before execution: @(R0 + 8) = H'12345670
                  ; After execution: R1 = H'12345670
```

6.3.20 MOV MOVE reverse stack Data Transfer Instruction

6.3.21 MOVI20 MOVE Immediate 20bits data Data Transfer Instruction

20-Bit Immediate Data Transfer SH-2A/SH2A-FPU (New)

| Format | Abstract | Code | Cycle | T Bit |
|-------------------|------------------------------|-------------------------------------|-------|-------|
| MOVI20 #imm20, Rn | imm → sign extension → Rn | 0000nnnniiii0000iiiiiiiiiiiiiiiiiii | 1 | — |

Description

Stores immediate data that has been sign-extended to longword in general register Rn.

Operation

```
MOVI20 (long i, long n)    /* MOVI20 #imm, Rn */
{
    if (i&0x00080000) ==0) R[n]= (0x000FFFFFF & (long) i);
    else R[n]=(0xFFF00000 | (long) i);

    PC+=4;
}
```

Examples:

```
MOVI20 H'7FFFF,R0    ; Before execution: R0 = H'00000000
                    ; After execution:   R0 = H'0007FFFF
```

6.3.22 MOVI20S MOVE Immediate 20bits data and 8bits Shift left

20-Bit Immediate Data Transfer and 8-Bit Left-Shift

Data Transfer Instruction
SH-2A/SH2A-FPU (New)

| Format | Abstract | Code | Cycle | T Bit |
|--------------------|------------------------------|------------------------------------|-------|-------|
| MOVI20S #imm20, Rn | imm<<8 → sign extension → Rn | 0000nnnniiii0001iiiiiiiiiiiiiiiiii | 1 | — |

Description

Shifts immediate data 8 bits to the left and performs sign extension to longword, then stores the resulting data in general register Rn. Using an OR or ADD instruction as the next instruction enables a 28-bit absolute address to be generated. See section Appendix B, Programming Guidelines, for details.

Note

For the Renesas Technology Super H RISC engine assembler, declarations should use immediate data that has been shifted 8 bits to the left.

Operation

```
MOVI20S (long i, long n)    /* MOVI20S #imm, Rn */
{
    if (i&0x00080000) ==0) R[n]= (0x000FFFFFF & (long) i);
    else R[n]=(0xFFF00000 | (long) i);
    R[n]<<=8;
    PC+=4;
}
```

Examples:

```
MOVI20S H'7FFFF,R0          ; Before execution: R0 = H'00000000
                              ; After execution:  R0 = H'07FFFF00
```

6.3.23 MOVML.L MOVE Multi-register Lower part Data Transfer Instruction

R0-Rn Register Save/Restore Instruction SH-2A/SH2A-FPU (New)

| Format | Abstract | Code | Cycle | T Bit |
|-------------------|---|------------------|---------|-------|
| MOVML.L Rm, @-R15 | R15 - 4 → R15, Rm → (R15) R15 - 4 → R15, Rm - 1 → (R15) : R15 - 4 → R15, R0 → (R15) Note: When Rm = R15, read Rm as PR | 0100mmmm11110001 | 1 to 16 | — |
| MOVML.L @R15+, Rn | (R15) → R0, R15 + 4 → R15 (R15) → R1, R15 + 4 → R15 : (R15) → Rn, R15 + 4 → R15 Note: When Rn = R15, read Rn as PR | 0100nnnn11110101 | 1 to 16 | — |

Description

Transfers a source operand to a destination. This instruction performs transfer between a number of general registers (R0 to Rn/Rm) not exceeding the specified register number and memory with the contents of R15 as its address.

If R15 is specified, PR is transferred instead of R15. That is, when nnnn(mmmm) = 1111 is specified, R0 to R14 and PR are the general registers subject to transfer.

Operation

```
MOVLMLL (long m) /*MOVML.L Rm, @-R15*/
```

```
{
    long i;

    for (i=m; i≥0; i--)
    {
        if (i==15)
        {
            Write_Long (R[15]-4, PR);
            R[15]-=4;
        }
    }
    else
```

```
    {
        Write_Long (R[15]-4, R[i]);
        R[15]-=4;
    }
}

PC+=2;
}

MOVL PML (long n) /*MOVML.L @R15+, Rn */
{
    int i;

    for (i=0; i<n; i++)
    {
        if (i==15)
        {
            PR=Read_Long (R[15]);
        }
        else
        {
            R[i] = Read_Long (R[15]);
        }
        R[15]+=4;
    }
    PC+=2;
}
```

Examples:

```

6.3.24 MOVMU.L MOVE Multi-register Upper part Data Transfer Instruction

Rn-R14, PR Register Save/Restore Instruction SH-2A/SH2A-FPU (New)

| Format | Abstract | Code | Cycle | T Bit |
|-------------------|---|------------------|---------|-------|
| MOVMU.L Rm, @-R15 | R15 - 4 → R15, PR → (R15) R15 - 4 → R15, R14 → (R15) : R15 - 4 → R15, Rm → (R15) Note: When Rm = R15, read Rm as PR | 0100mmmm11110000 | 1 to 16 | — |
| MOVMU.L @R15+, Rn | (R15) → Rn, R15 + 4 → R15 (R15) → Rn + 1, R15 + 4 → R15 : (R15) → R14, R15 + 4 → R15 (R15) → PR, R15 + 4 → R15 Note: When Rn = R15, read Rn as PR | 0100nnnn11110100 | 1 to 16 | — |

Description

Transfers a source operand to a destination. This instruction performs transfer between a number of general registers (Rn/Rm to R14, PR) not lower than the specified register number and memory with the contents of R15 as its address.

If R15 is specified, PR is transferred instead of R15.

Operation

```

MOVLMMU (long m) /*MOVMU.L Rm, @-R15 */
{
    int i;

    Write_Long (R[15]-4, PR);
    R[15]-=4;

    for (i = 14; i≥m; i--)
    {
        Write_Long (R[15]-4, R[i]);
        R[15]-=4;
    }
}

```

```
PC+=2;
}

MOVLPMU (long n) /*MOVML.L @R15+, Rn*/
{
    int i;

    for (i=n; i<=14; i++)
    {
        R[i] = Read_Long (R[15]);
        R[15]+=4;
    }
    PR=Read_Long (R[15]);
    R[15]+=4;
    PC+=2;
}
```

Examples:

```
MOVMMU. L R8,@-R15 ; Before execution: R15 = H'FFFF7F80
                                         R8 = H'88888888, R9 = H'99999999
                                         R10 = H'AAAAAAAA, R11 = H'BBBBBBBB

| | T Bit Reverse Rn Transfer | | SH-2A/SH2A-FPU (New) |

| Format | Abstract | Code | Cycle | T Bit |
|----------|-------------------------|------------------|-------|-------|
| MOVRT Rn | $\sim T \rightarrow Rn$ | 0000nnnn00111001 | 1 | — |

Description

Reverses the T bit and then stores the resulting value in general register Rn. The value of Rn is 0 when T = 1 and 1 when T = 2.

Operation

```
MOVRT (long n) /*MOVRT Rn */
{
  if (T ==1) R[n]=0x00000000;
  else R[n] = 0x00000001;
  PC+=2;
}
```

Examples:

```
XOR      R2, R2      ; R2 = 0
CMP/PZ   R2          ; T = 1
MOVRT    R0          ; R0 = 0
CLRT     R0          ; T = 0
MOVRT    R1          ; R1 = 1
```

6.3.26 MOVU MOVe structure data as Unsigned Data Transfer Instruction
 Structure Data Unsigned Transfer SH-2A/SH2A-FPU (New)

| Format | Abstract | Code | Cycle | T Bit |
|--------------------------|-----------------------------------|---------------------------------|-------|-------|
| MOVU.B @ (disp12,Rm), Rn | (disp+Rm) → zero extension → Rn | 0011nnnnmmmm00011000ddddddddddd | 1 | — |
| MOVU.W @ (disp12,Rm), Rn | (disp×2+Rm) → zero extension → Rn | 0011nnnnmmmm00011001ddddddddddd | 1 | — |

Description

Transfers a source operand to a destination, performing unsigned data transfer. This instruction is ideal for data access in a structure or the stack.

Note

For the Renesas Technology Super H RISC engine assembler, declarations should use scaled values (×1, ×2) as displacement values.

Operation

```

MOVBUL12 (long d, long m, long n) /* MOVU.B @(disp12,Rm), Rn */
{
    long disp;

    disp = (0x00000FFF & (long)d);
    R[n]=Read_Byte(R[m]+disp);
    R[n] &=0x000000FF;
    PC+=4;
}

MOVWUL12 (long d, long m, long n) /* MOVU.W @(disp12,Rm), Rn */
{
    long disp;

    disp = (0x00000FFF & (long)d);
    R[n]=Read_Word(R[m]+(disp<<1));
    R[n] &=0x0000FFFF;
    PC+=4;
}

```

Examples:

```

MOVU.B @(2,R0),R1 ; Before execution: @(R0 + 2) = H'FF
                  ; After execution: R1 = H'000000FF

MOVU.W @(2,R0),R1 ; Before execution: @(R0 + 4) = H'FFFF
                  ; After execution: R1 = H'0000FFFF

```

| 6.3.27 | MULR Rn Result Storage Signed Multiplication | MULTiPLY to Register | Arithmetic Instruction SH-2A/SH2A-FPU (New) |
|---------------|--|-----------------------------|---|

| Format | Abstract | Code | Cycle | T Bit |
|------------|-------------------------------|------------------|-------|-------|
| MULR R0,Rn | $R0 \times Rn \rightarrow Rn$ | 0100nnnn10000000 | 2 | — |

Description

Performs 32-bit multiplication of the contents of general register R0 by Rn, and stores the lower 32 bits of the result in general register Rn.

Operation

```
MULR (long n) /* MULR R0, Rn */
{
    R[n] = R[0]*R[n];
    PC+=2;
}
```

Examples:

```
MULR R0,R1 ; Before execution: R0 = H'FFFFFFFE, R1 = H'00005555
           ; After execution: R1 = H'FFFF5556
```

| 6.3.28 | NOTT T Bit Inversion and Transfer | NOT Tbit | Data Transfer Instruction SH-2A/SH2A-FPU (New) |
|---------------|---|-----------------|--|

| Format | Abstract | Code | Cycle | T Bit |
|--------|------------------------|------------------|-------|------------------|
| NOTT | $\sim T \rightarrow T$ | 0000000001101000 | 1 | Operation result |

Description

Inverts the T bit, then stores the resulting value in the T bit.

Operation

```

NOTT (long n) /*NOTT Rn */
{
    if (T ==1) T=0;
    else T=1;
    PC+=2;
}

```

Examples:

```

SETT ;T = 1
NOTT ;T = 0
NOTT ;T = 1

```

| 6.3.29 | PREF Prefetch to Data Cache | PREFetch data to cache | Data Transfer Instruction SH-2A/SH2A-FPU (New) |
|---------------|---------------------------------------|-------------------------------|--|

| Format | Abstract | Code | Cycle | T Bit |
|----------|----------------------|------------------|-------|-------|
| PREF @Rn | Prefetch cache block | 0000nnnn10000011 | 1 | — |

Description

Reads a 16-byte data block starting at a 16-byte boundary into the operand cache.

Address related errors are not generated for this instruction. In the event of an error, this instruction is handled as an NOP (no operation) instruction.

Note

On products with no cache, this instruction is handled as a NOP instruction.

Operation

```
PREF (long n) /* PREF @Rn */
{
  PC+=2;
}
```

Examples:

```
MOV.L SOFT_PF,R1      ; R1 address is SOFT_PF
PREF    @R1           ; Load SOFT_PF data into internal data cache
```

```
.align 16
```

| RESBANK | Restoration from register bank | 0000000001011011 | 9* | — |

Note: * 19 when a bank overflow has occurred and the register is restored from the stack

Description

Restores the last register saved to a register bank.

Operation

```

RESBANK( )    /*RESBANK */
              /*m = (Number of register bank to which a save was last
performed)*/
{
  int m;

  if(BO==0)
  {
    PR = Register_Bank[m].PR_BANK;
    GBR = Register_Bank[m].GBR_BANK;
    MACL = Register_Bank[m].MACL_BANK;
    MACH = Register_Bank[m].MACH_BANK;
    for (i=14; i<=14; i++)
        i≥0; i--
    {
      R[i] = Register_Bank[m].R_BANK[i];
    }
  }
  else
  {
    for (i=0; i<=14; i++)
    {
      R[i] = Read_Long(R[15]);
      R[15]+=4;
    }
  }
}

```

```
    }  
    PR=Read_Long (R[15]);  
    R[15]+=4;  
    GBR=Read_Long (R[15]);  
    R[15]+=4;  
    MACH=Read_Long (R[15]);  
    R[15]+=4;  
    MACL =Read_Long (R[15]);  
    R[15]+=4;  
}
```

```
PC+=2;
```

```
}
```

Examples:

```
RESBANK          ; Recover register from register bank.  
RTE              ; Return to original routine.  
ADD #8, R14      ; Executed before branch.
```

| | | | |

| 6.3.31 | RTS/N | ReTurn from Subroutine with No delay slot | Branch Instruction |
| | | Return from Subroutine Procedure with No Delay Slot | SH-2A/SH2A-FPU (New) |

| Format | Abstract | Code | Cycle | T Bit |
|--------|----------|------------------|-------|-------|
| RTS/N | PR → PC | 0000000001101011 | 3 | — |

Description

Performs a return from a subroutine procedure. That is, the PC is restored from PR, and processing is resumed from the address indicated by the PC. This instruction enables a return to be made from a subroutine procedure called by a BSR or JSR instruction to the origin of the call.

Note

This is not a delayed branch instruction.

Operation

```
RTSN ( ) /* RTS/N */
{
    PC=PR+4;
}
```

Examples:

```

MOV.L TABLE, R3          ; R0 = TRGET address
JSR/N @R3                 ; Branch to TRGET.
ADD R0, R1                ; ← Procedure return destination
                          (PR contents)

. . . . .
TABLE: .data.1 TRGET      ; Jump table
. . . . .

TRGET: NOP                ; ← Entry to procedure
MOV R2, R3                ;
RTS/N                     ; Return to above ADD instruction.
```

| 6.3.32 RTV/N | ReTurn to Value and from subroutine with No delay slot | Branch Instruction |
| | Return from Subroutine Procedure with Register Value Transfer and with No Delay Slot | SH-2A/SH2A-FPU (New) |

| Format | Abstract | Code | Cycle | T Bit |
|----------|------------------|------------------|-------|-------|
| RTV/N Rm | Rm → R0, PR → PC | 0000mmmm01111011 | 3 | — |

Description

Performs a return from a subroutine procedure after a transfer from specified general register Rm to R0. That is, after the Rm value is stored in R0, the PC is restored from PR, and processing is resumed from the address indicated by the PC. This instruction enables a return to be made from a subroutine procedure called by a BSR or JSR instruction to the origin of the call.

Note

This is not a delayed branch instruction.

Operation

```
RTVN (int m) /* RTV/N Rm */
{
    R[0]=R[m];
    PC=PR+4;
}
```

Examples:

```

MOV.L TABLE, R3          ; R0 = TRGET address
JSR/N @R3                 ; Branch to TRGET.
ADD R0, R1                 ; ← Procedure return destination
                           (PR contents)
. . . . .
TABLE: .data.1 TRGET      ; Jump table
. . . . .
TRGET: NOP                 ; ← Entry to procedure
MOV #12, R3               ; R3 = H'00000012
RTV/N R3                  ; Return to above ADD instruction.
                           ; R0 = H'00000012

```

6.3.33 SHAD Shift Arithmetic Dynamically Shift Instruction

Dynamic Arithmetic Shift

| Format | Abstract | Code | Cycle | T Bit |
|-------------|---|------------------|-------|-------|
| SHAD Rm, Rn | When $Rm \geq 0$, $Rn \ll Rm \rightarrow Rn$ When $Rm < 0$, $Rn \gg Rm \rightarrow [MSB \rightarrow Rn]$ | 0100nnnnmmmm1100 | 1 | — |

Description

Shifts the contents of general register Rn arithmetically. General register Rm specifies the shift direction and number of bits to be shifted.

A left shift is performed when the Rm register value is positive, and a right shift when negative. In a right shift, the MSB is added at the upper end.

The number of bits to be shifted is specified by the lower 5 bits (bits 4 to 0) of register Rm. If the value is negative (MSB = 1), the Rm register value is expressed as a two's complement. Therefore, the shift amount in a right shift is the value obtained by adding 1 to the inverse of the lower 5 bits of register Rm. The shift amount is 0 to 31 in a left shift, and 1 to 32 in a right shift.

Operation

```

SHAD (int m,n) /* SHAD Rm,Rn */
{
    int sgn = R[m] & 0x80000000;
    if (sgn == 0)
        R[n] <<= (R[m] & 0x0000001F);
    else if ((R[m] & 0x0000001F) == 0)
    {
        if ((R[n] & 0x80000000) == 0)
            R[n] = 0;
        else
            R[n]=0xFFFFFFFF;
    }
    else
        R[n]=(long)R[n] >> ((~R[m] & 0x0000001F)+1);
    PC+=2;
}

```

Examples:

```

SHAD R1, R2                ; Before execution: R1 = H'FFFFFFEC, R2 = H'80180000
                            ; After execution:  R1 = H'FFFFFFEC, R2 = H'FFFFFF801

SHAD R3, R4                ; Before execution: R3 = H'00000014, R2 = H'FFFFFF801
                            ; After execution:  R3 = H'00000014, R2 = H'80100000

```

6.3.34 SHLD Shift Logical Dynamically Shift Instruction

Dynamic Logical Shift

| Format | Abstract | Code | Cycle | T Bit |
|-------------|---|------------------|-------|-------|
| SHLD Rm, Rn | When $Rm \geq 0$, $Rn \ll Rm \rightarrow Rn$ When $Rm < 0$, $Rn \gg Rm \rightarrow [0 \rightarrow Rn]$ | 0100nnnnmmmm1101 | 1 | — |

Description

Shifts the contents of general register Rn logically. General register Rm specifies the shift direction and number of bits to be shifted.

A left shift is performed when the Rm register value is positive, and a right shift when negative. In a right shift, 0 is added at the upper end.

The number of bits to be shifted is specified by the lower 5 bits (bits 4 to 0) of register Rm. If the value is negative (MSB = 1), the Rm register value is expressed as a two's complement. Therefore, the shift amount in a right shift is the value obtained by adding 1 to the inverse of the lower 5 bits of register Rm. The shift amount is 0 to 31 in a left shift, and 1 to 32 in a right shift.

Operation

```

SHLD (int m,n) /* SHLD Rm,Rn */
{
    int  sgn = R[m] & 0x80000000;
    if  (sgn == 0)
        R[n] <= (R[m] & 0x0000001F);
    else if ((R[m] & 0x0000001F) == 0)
        R[n] = 0;
    else
        R[n]=(unsigned)R[n] >> ((~R[m] & 0x0000001F)+1);
    PC+=2;
}

```

Examples:

```

SHLD R1, R2           ; Before execution: R1 = H'FFFFFFEC, R2 = H'80180000
                      ; After execution:  R1 = H'FFFFFFEC, R2 = H'00000801

SHLD R3, R4           ; Before execution: R3 = H'00000014, R2 = H'FFFFFF801
                      ; After execution:  R3 = H'00000014, R2 = H'80100000

```

6.3.35 STBANK STore register BANK

System Control Instruction

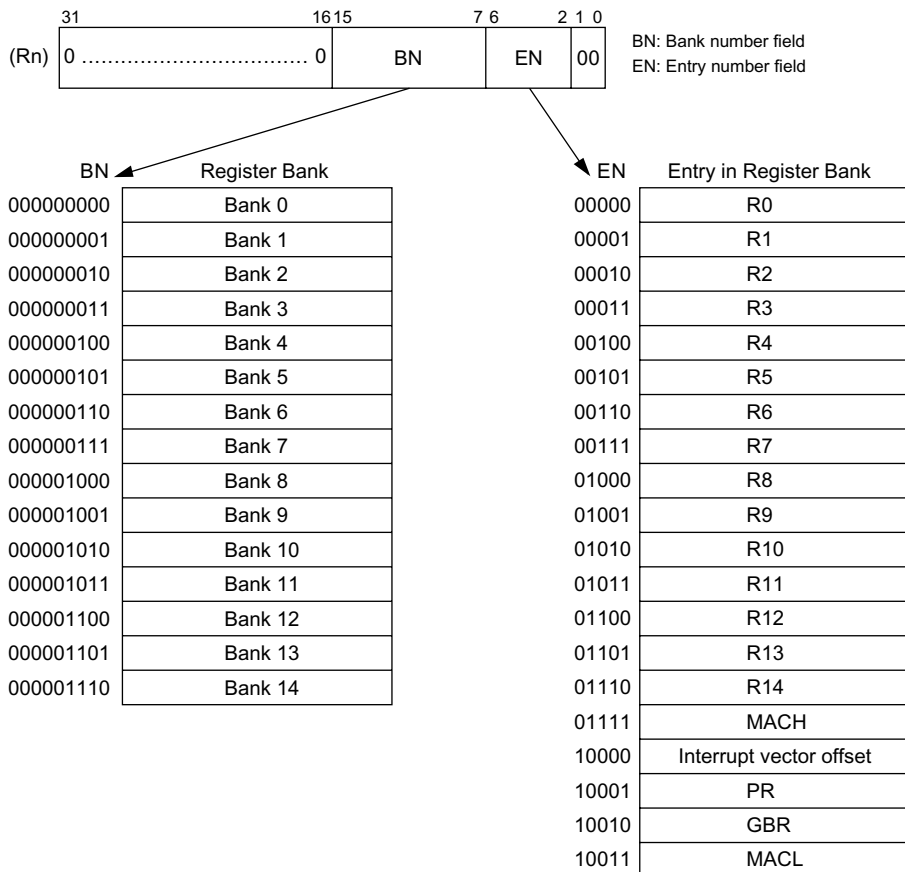

Register Save to Specified Bank Entry

SH-2A/SH2A-FPU (New)

| Format | Abstract | Code | Cycle | T Bit |
|----------------|--------------------------------------|------------------|-------|-------|
| STBANK R0, @Rn | R0 → (specified register bank entry) | 0100nnnn11100001 | 7 | — |

Description

R0 is transferred to the register bank entry indicated by the contents of general register Rn. The register bank number and register stored in the bank are specified by general register Rn.

Note

The architecture supports a maximum of 512 banks. However, the number of banks differs depending on the product.

Operation

```
STBANK (long n) /*STBANK R0, @Rn */
{
  Write_Bank_Long (R[n], R[0])
  PC+=2;
}
```

Examples:

```
STBANK R0,@R1 ; Before execution: R1 = H'00000108, R0 = H'FFFFFFFF
               ; After execution: Contents of R2 stored R2 = H'FFFFFFFF
```

| | | | |
|---------------|---|-------------------------------|---|
| 6.3.36 | STC Store from Control Register | Store Control register | System Control Instruction SH-2A/SH2A-FPU (New) |
|---------------|---|-------------------------------|---|

| Format | Abstract | Code | Cycle | T Bit |
|-------------|----------|------------------|-------|-------|
| STC TBR, Rn | TBR → Rn | 0000nnnn01001010 | 1 | — |

Description

Stores data in control register TBR in a destination.

Operation

```
STCTBR(long n) /* STC TBR, Rn*/
{
    R[n]=TBR;
    PC+=2;
}
```

Examples:

```
STC TBR,R0 ; Before execution: R0 = H'12345678, TBR = H'00000000
           ; After execution: R0 = H'00000000
```

6.4 SH-2E CPU Instructions

6.4.1 ADD ADD Binary Arithmetic Instruction Binary Addition

| Format | Abstract | Code | Cycle | T Bit |
|-------------|---------------------------|------------------|-------|-------|
| ADD Rm,Rn | $Rm + Rn \rightarrow Rn$ | 0011nnnnmmmm1100 | 1 | — |
| ADD #imm,Rn | $Rn + imm \rightarrow Rn$ | 0111nnnniiiiiii | 1 | — |

Description

Adds general register Rn data to Rm data, and stores the result in Rn. 8-bit immediate data can be added instead of Rm data. Since the 8-bit immediate data is sign-extended to 32 bits, this instruction can add and subtract immediate data.

Operation

```
ADD(long m, long n) /* ADD Rm,Rn */
{
    R[n]+=R[m];
    PC+=2;
}
ADDI(long i, long n) /* ADD #imm,Rn */
{
    if ((i&0x80)==0) R[n]+=(0x000000FF & (long)i);
    else R[n]+=(0xFFFFFFFF00 | (long)i);
    PC+=2;
}
```

Examples:

```
ADD R0,R1 ; Before execution: R0 = H'7FFFFFFF, R1 = H'00000001
; After execution: R1 = H'80000000
ADD #H'01,R2 ; Before execution: R2 = H'00000000
; After execution: R2 = H'00000001
ADD #H'FE,R3 ; Before execution: R3 = H'00000001
; After execution: R3 = H'FFFFFFF
```

| | | | |
|--------------|--|-----------------------|-------------------------------|
| 6.4.2 | ADDC Binary Addition with Carry | ADD with Carry | Arithmetic Instruction |
|--------------|--|-----------------------|-------------------------------|

| Format | Abstract | Code | Cycle | T Bit |
|---------------|--|------------------|--------------|--------------|
| ADDC Rm,Rn | $Rn + Rm + T \rightarrow Rn, \text{carry} \rightarrow T$ | 0011nnnnmmmm1110 | 1 | Carry |

Description

Adds Rm data and the T bit to general register Rn data, and stores the result in Rn. The T bit changes according to the result. This instruction can add data that has more than 32 bits.

Operation

```
ADDC (long m, long n)      /* ADDC Rm, Rn */
{
    unsigned long tmp0, tmp1;

    tmp1=R[n]+R[m];
    tmp0=R[n];
    R[n]=tmp1+T;
    if (tmp0>tmp1) T=1;
    else T=0;
    if (tmp1>R[n]) T=1;
    PC+=2;
}
```

Examples:

```
CLRT          ; R0:R1 (64 bits) + R2:R3 (64 bits) = R0:R1 (64 bits)
ADDC  R3, R1  ; Before execution: T = 0, R1 = H'00000001, R3 = H'FFFFFFFF
              ; After execution:  T = 1, R1 = H'00000000
ADDC  R2, R0  ; Before execution: T = 1, R0 = H'00000000, R2 = H'00000000
              ; After execution:  T = 0, R0 = H'00000001
```

6.4.3 ADDV **ADD with (V flag) overflow check** **Arithmetic Instruction**
 Binary Addition
 with Overflow Check

| Format | Abstract | Code | Cycle | T Bit |
|------------|--|--------------------|-------|----------|
| ADDV Rm,Rn | $R_n + R_m \rightarrow R_n$, overflow $\rightarrow T$ | 0011nnnnnnmmmm1111 | 1 | Overflow |

Description

Adds general register Rn data to Rm data, and stores the result in Rn. If an overflow occurs, the T bit is set to 1.

Operation

```

ADDV(long m, long n)    /*ADDV Rm, Rn */
{
    long dest, src, ans;

    if ((long)R[n]>=0) dest=0;
    else dest=1;
    if ((long)R[m]>=0) src=0;
    else src=1;
    src+=dest;
    R[n]+=R[m];
    if ((long)R[n]>=0) ans=0;
    else ans=1;
    ans+=dest;
    if (src==0 || src==2) {
        if (ans==1) T=1;
        else T=0;
    }
    else T=0;
    PC+=2;
}

```

Examples:

```
ADDV  R0,R1    ; Before execution: R0 = H'00000001, R1 = H'7FFFFFFE, T = 0
          ; After execution:       R1 = H'7FFFFFFF, T = 0

ADDV  R0,R1    ; Before execution: R0 = H'00000002, R1 = H'7FFFFFFE, T = 0
          ; After execution:       R1 = H'80000000, T = 1
```

6.4.4 AND AND logical Logical Instruction

| Format | Abstract | Code | Cycle | T Bit |
|-----------------------|-------------------------------|------------------|-------|-------|
| AND Rm,Rn | Rn & Rm → Rn | 0010nnnnmmmm1001 | 1 | — |
| AND #imm,R0 | R0 & imm → R0 | 11001001iiiiiii | 1 | — |
| AND.B #imm, @(R0,GBR) | (R0 + GBR) & imm → (R0 + GBR) | 11001101iiiiiii | 3 | — |

Description

Logically ANDs the contents of general registers Rn and Rm, and stores the result in Rn. The contents of general register R0 can be ANDed with zero-extended 8-bit immediate data. 8-bit memory data pointed to by GBR relative addressing can be ANDed with 8-bit immediate data.

Note

After AND #imm, R0 is executed and the upper 24 bits of R0 are always cleared to 0.

Operation

```
AND(long m, long n) /* AND Rm, Rn */
{
    R[n] &= R[m]
    PC += 2;
}
ANDI(long i) /* AND #imm, R0 */
{
    R[0] &= (0x000000FF & (long)i);
    PC += 2;
}
ANDM(long i) /* AND.B #imm, @(R0, GBR) */
{
    long temp;
    temp = (long)Read_Byte(GBR + R[0]);
    temp &= (0x000000FF & (long)i);
    Write_Byte(GBR + R[0], temp);
    PC += 2;
}
```

Examples:

```
AND    R0, R1          ; Before execution: R0 = H'AAAAAAAA, R1 = H'55555555
                          ; After execution:  R1 = H'00000000
AND    #H'0F, R0       ; Before execution: R0 = H'FFFFFFFF
                          ; After execution:  R0 = H'0000000F
AND.B  #H'80, @(R0, GBR) ; Before execution: @(R0, GBR) = H'A5
                          ; After execution:  @(R0, GBR) = H'80
```

6.4.5 BF Branch if False Branch Instruction

Conditional Branch

| Format | Abstract | Code | Cycle | T Bit |
|----------|---|------------------|-------|-------|
| BF label | When T = 0, $\text{disp} \times 2 + \text{PC} \rightarrow \text{PC}$; When T = 1, nop | 10001011dddddddd | 3/1 | — |

Description

Reads the T bit, and conditionally branches. If T = 0, it branches to the branch destination address. If T = 1, BF executes the next instruction. The branch destination is an address specified by PC + displacement. However, in this case it is used for address calculation. The PC is the address 4 bytes after this instruction. The 8-bit displacement is sign-extended and doubled. Consequently, the relative interval from the branch destination is -256 to +254 bytes. If the displacement is too short to reach the branch destination, use BF with the BRA instruction or the like.

Note

When branching, three cycles; when not branching, one cycle.

Operation

```
BF(long d) /* BF disp */
{
    long disp;

    if ((d&0x80)==0) disp=(0x000000FF & (long)d);
    else disp=(0xFFFFFFFF00 | (long)d);
    if (T==0) PC=PC+(disp<<1);
    else PC+=2;
}
```

Example:

```
CLRT                ; T is always cleared to 0
BT   TRGET_T        ; Does not branch, because T = 0
BF   TRGET_F        ; Branches to TRGET_F, because T = 0
NOP                                ;
NOP                                ; ← The PC location is used to calculate the branch destination
.....                          address of the BF instruction
TRGET_F:                       ; ← Branch destination of the BF instruction
```

| | | | |
|--------------|-------------------------------|--|----------------------------|
| 6.4.6 | BF/S | Branch if False with delay Slot | Branch Instruction |
| | Conditional Branch with Delay | | Delayed Branch Instruction |

| Format | Abstract | Code | Cycle | T Bit |
|---------------|---|-----------------|--------------|--------------|
| BF/S label | When T = 0, $\text{disp} \times 2 + \text{PC} \rightarrow \text{PC}$; When T = 1, nop | 10001111ddddddd | 2/1 | — |

Description

Reads the T bit and conditionally branches. If T = 0, it branches after executing the next instruction. If T = 1, BF/S executes the next instruction. The branch destination is an address specified by PC + displacement. However, in this case it is used for address calculation. The PC is the address 4 bytes after this instruction. The 8-bit displacement is sign-extended and doubled. Consequently, the relative interval from the branch destination is -256 to +254 bytes. If the displacement is too short to reach the branch destination, use BF with the BRA instruction or the like.

Note

Since this is a delay branch instruction, the instruction immediately following is executed before the branch. No interrupts and address errors are accepted between this instruction and the next instruction. When the instruction immediately following is a branch instruction, it is recognized as an illegal slot instruction. When branching, this is a two-cycle instruction; when not branching, one cycle.

Operation

```

BFS(long d) /* BFS disp */
{
    long disp;
    unsigned long temp;

    temp=PC;
    if ((d&0x80)==0) disp=(0x000000FF & (long)d);
    else disp=(0xFFFFFFFF0 | (long)d);
    if (T==0) {
        PC=PC+(disp<<1);
        Delay_Slot(temp+2);
    }
    else PC+=2;
}

```

Example:

```

CLRT          ; T is always 0
BT/S TRGET_T  ; Does not branch, because T = 0
NOP           ;
BF/S TRGET_F  ; Branches to TRGET_F, because T = 0
ADD R0,R1    ; Executed before branch.
NOP          ; ← The PC location is used to calculate the branch destination
.....      ; address of the BF/S instruction
TRGET_F:     ; ← Branch destination of the BF/S instruction

```

Note: When a delayed branch instruction is used, the branching operation takes place after the slot instruction is executed, but the execution of instructions (register update, etc.) takes place in the sequence delayed branch instruction → delayed slot instruction. For example, even if a delayed slot instruction is used to change the register where the branch destination address is stored, the register content previous to the change will be used as the branch destination address.

| | | | |
|--------------|------------------------------------|---------------|---|
| 6.4.7 | BRA Unconditional Branch | BRAnch | Branch Instruction Delayed Branch Instruction |
|--------------|------------------------------------|---------------|---|

| Format | Abstract | Code | Cycle | T Bit |
|---------------|--------------------|-----------------|--------------|--------------|
| BRA label | disp × 2 + PC → PC | 1010ddddddddddd | 2 | — |

Description

Branches unconditionally after executing the instruction following this BRA instruction. The branch destination is an address specified by PC + displacement. However, in this case it is used for address calculation. The PC is the address 4 bytes after this instruction. The 12-bit displacement is sign-extended and doubled. Consequently, the relative interval from the branch destination is -4096 to +4094 bytes. If the displacement is too short to reach the branch destination, this instruction must be changed to the JMP instruction. Here, a MOV instruction must be used to transfer the destination address to a register.

Note

Since this is a delayed branch instruction, the instruction after BRA is executed before branching. No interrupts and address errors are accepted between this instruction and the next instruction. If the next instruction is a branch instruction, it is acknowledged as an illegal slot instruction.

Operation

```
BRA(long d) /* BRA disp */
{
    unsigned long temp;
    long disp;

    if ((d&0x800)==0) disp=(0x00000FFF & (long) d);
    else disp=(0xFFFFF000 | (long) d);
    temp=PC;
    PC=PC+(disp<<1);
    Delay_Slot(temp+2);
}
```

Example:

```
BRA    TRGET ; Branches to TRGET
ADD    R0, R1 ; Executes ADD before branching
NOP                    ; ← The PC location is used to calculate the branch destination
        .....        address of the BRA instruction
TRGET:                    ; ← Branch destination of the BRA instruction
```

Note: When a delayed branch instruction is used, the branching operation takes place after the slot instruction is executed, but the execution of instructions (register update, etc.) takes place in the sequence delayed branch instruction → delayed slot instruction. For example, even if a delayed slot instruction is used to change the register where the branch destination address is stored, the register content previous to the change will be used as the branch destination address.

| 6.4.8 | BRAF Unconditional Branch | BRAnch Far | Branch Instruction Delayed Branch Instruction |
|---------------|-------------------------------------|-------------------|---|
| Format | Abstract | Code | Cycle T Bit |
| BRAF Rm | Rm + PC → PC | 0000mmmm00100011 | 2 — |

Description

Branches unconditionally. The branch destination is PC + the 32-bit contents of the general register Rm. However, in this case it is used for address calculation. The PC is the address 4 bytes after this instruction.

Note

Since this is a delayed branch instruction, the instruction after BRAF is executed before branching. No interrupts and address errors are accepted between this instruction and the next instruction. If the next instruction is a branch instruction, it is acknowledged as an illegal slot instruction.

Operation

```
BRAF(long m) /* BRAF Rm */
{
    unsigned long temp;

    temp=PC;
    PC=PC+R[m];
    Delay_Slot(temp+2);
}
```

Example:

```
MOV.L # (TARGET-BSRF_PC) , R0 ; Sets displacement.
BRA   TRGET                    ; Branches to TARGET
ADD   R0, R1                   ; Executes ADD before branching
BRAF_PC:                       ; ← The PC location is used to calculate the branch
                                ; destination address of the BRAF instruction

NOP
.....
TARGET:                        ; ← Branch destination of the BRAF instruction
```

Note: When a delayed branch instruction is used, the branching operation takes place after the slot instruction is executed, but the execution of instructions (register update, etc.) takes place in the sequence delayed branch instruction → delayed slot instruction. For example, even if a delayed slot instruction is used to change the register where the branch destination address is stored, the register content previous to the change will be used as the branch destination address.

| 6.4.9 BSR | | Branch to SubRoutine | Branch Instruction | | |
|-----------|----------------------------|--------------------------------|----------------------------|-------|--|
| | | Branch to Subroutine Procedure | Delayed Branch Instruction | | |
| Format | Abstract | Code | Cycle | T Bit | |
| BSR label | PC → PR, disp × 2+ PC → PC | 1011ddddddddddd | 2 | — | |

Description

Branches to the subroutine procedure at a specified address. The PC value is stored in the PR, and the program branches to an address specified by PC + displacement. However, in this case it is used for address calculation. The PC is the address 4 bytes after this instruction. The 12-bit displacement is sign-extended and doubled. Consequently, the relative interval from the branch destination is -4096 to +4094 bytes. If the displacement is too short to reach the branch destination, the JSR instruction must be used instead. With JSR, the destination address must be transferred to a register by using the MOV instruction. This BSR instruction and the RTS instruction are used together for a subroutine procedure call.

Note

Since this is a delayed branch instruction, the instruction after BSR is executed before branching. No interrupts and address errors are accepted between this instruction and the next instruction. If the next instruction is a branch instruction, it is acknowledged as an illegal slot instruction.

Operation

```
BSR(long d) /* BSR disp */
{
    long disp;

    if ((d&0x800)==0) disp=(0x00000FFF & (long) d);
    else disp=(0xFFFFF000 | (long) d);
    PR=PC+Is_32bit_Inst(PR+2);
    PC=PC+(disp<<1);
    Delay_Slot(PR+2);
}
```

Example:

```
BSR    TRGET    ; Branches to TRGET
MOV    R3, R4   ; Executes the MOV instruction before branching
ADD    R0, R1   ; ← The PC location is used to calculate the branch destination address of
                ; the BSR instruction (return address for when the subroutine procedure is
                ; completed (PR data))
. . . . .
. . . . .
TRGET:                ; ← Procedure entrance
MOV    R2, R3   ;
RTS                    ; Returns to the above ADD instruction
MOV    #1, R0   ; Executes MOV before branching
```

Note: When a delayed branch instruction is used, the branching operation takes place after the slot instruction is executed, but the execution of instructions (register update, etc.) takes place in the sequence delayed branch instruction → delayed slot instruction. For example, even if a delayed slot instruction is used to change the register where the branch destination address is stored, the register content previous to the change will be used as the branch destination address.

| Format | Abstract | Code | Cycle | T Bit |
|---------|-----------------------|------------------|-------|-------|
| BSRF Rm | PC → PR, Rm + PC → PC | 0000mmmm00000011 | 2 | — |

Description

Branches to the subroutine procedure at a specified address after executing the instruction following this BSRF instruction. The PC value is stored in the PR. The branch destination is PC + the 32-bit contents of the general register Rm. However, in this case it is used for address calculation. The PC is the address 4 bytes after this instruction. Used as a subroutine procedure call in combination with RTS.

Note

Since this is a delayed branch instruction, the instruction after BSR is executed before branching. No interrupts and address errors are accepted between this instruction and the next instruction. If the next instruction is a branch instruction, it is acknowledged as an illegal slot instruction.

Operation

```
BSRF(long m) /* BSRF Rm */
{
    PR=PC
    PC=PC+R[m];
    Delay_Slot(PR+2);
}
```

Example:

```
MOV.L # (TARGET-BSRF_PC), R0 ; Sets displacement.
BSRF R0 ; Branches to TARGET
MOV R3, R4 ; Executes the MOV instruction before branching
BSRF_PC: ; ← The PC location is used to calculate the branch
          ; destination with BSRF.
ADD R0, R1
.....
.....
TARGET: ; ← Procedure entrance
MOV R2, R3 ;
RTS ; Returns to the above ADD instruction
MOV #1, R0 ; Executes MOV before branching
```

Note: When a delayed branch instruction is used, the branching operation takes place after the slot instruction is executed, but the execution of instructions (register update, etc.) takes place in the sequence delayed branch instruction → delayed slot instruction. For example, even if a delayed slot instruction is used to change the register where the branch destination address is stored, the register content previous to the change will be used as the branch destination address.

| | | | |
|---------------|--------------------|-----------------------|---------------------------|
| 6.4.11 | BT | Branch if True | Branch Instruction |
| | Conditional Branch | | |

| Format | Abstract | Code | Cycle | T Bit |
|-------------|---|------------------|-------|-------|
| BT label | When T = 1, $\text{disp} \times 2 + \text{PC} \rightarrow \text{PC}$; When T = 0, nop | 10001001dddddddd | 3/1 | — |

Description

Reads the T bit, and conditionally branches. If T = 1, BT branches. If T = 0, BT executes the next instruction. The branch destination is an address specified by PC + displacement. However, in this case it is used for address calculation. The PC is the address 4 bytes after this instruction. The 8-bit displacement is sign-extended and doubled. Consequently, the relative interval from the branch destination is -256 to +254 bytes. If the displacement is too short to reach the branch destination, use BT with the BRA instruction or the like.

Note

When branching, requires three cycles; when not branching, one cycle.

Operation

```
BT(long d)    /* BT disp */
{
    long disp;

    if ((d&0x80)==0) disp=(0x000000FF & (long)d);
    else disp=(0xFFFFFFFF00 | (long)d);
    if (T==1) PC=PC+(disp<<1);
    else PC+=2;
}
```

Example:

```
    SETT                ; T is always 1
    BF    TRGET_F      ; Does not branch, because T = 1
    BT    TRGET_T      ; Branches to TRGET_T, because T = 1
    NOP                ;
    NOP                ; ← The PC location is used to calculate the branch destination
    .....            ; address of the BT instruction
TRGET_T:              ; ← Branch destination of the BT instruction
```

| 6.4.12 BT/S | | Branch if True with delay Slot | Branch Instruction | | |
|-------------|---|--------------------------------|----------------------------|-------|--|
| | | Conditional Branch with Delay | Delayed Branch Instruction | | |
| Format | Abstract | Code | Cycle | T Bit | |
| BT/S label | When T = 1, $\text{disp} \times 2 + \text{PC} \rightarrow \text{PC}$; When T = 0, nop | 10001101ddddddd | 2/1 | — | |

Description

Reads the T bit and conditionally branches. If T = 1, BT/S branches after the following instruction executes. If T = 0, BT/S executes the next instruction. The branch destination is an address specified by PC + displacement. However, in this case it is used for address calculation. The PC is the address 4 bytes after this instruction. The 8-bit displacement is sign-extended and doubled. Consequently, the relative interval from the branch destination is –256 to +254 bytes. If the displacement is too short to reach the branch destination, use BT/S with the BRA instruction or the like.

Note

Since this is a delay branch instruction, the instruction immediately following is executed before the branch. No interrupts and address errors are accepted between this instruction and the next instruction. When the immediately following instruction is a branch instruction, it is recognized as an illegal slot instruction. When branching, requires two cycles; when not branching, one cycle.

Operation

```

BTS(long d) /* BTS disp */
{
    long disp;
    unsigned long temp;

    temp=PC;
    if ((d&0x80)==0) disp=(0x000000FF & (long)d);
    else disp=(0xFFFFFFFF00 | (long)d);
    if (T==1) {
        PC=PC+(disp<<1);
        Delay_Slot(temp+2);
    }
    else PC+=2;
}

```

Example:

```

    SETT                ; T is always 1
    BF/S TARGET_F      ; Does not branch, because T = 1
    NOP                ;
    BT/S TARGET_T      ; Branches to TARGET, because T = 1
    ADD R0,R1          ; Executes before branching.
    NOP                ; ← The PC location is used to calculate the branch destination
    .....             ; address of the BT/S instruction
TARGET_T:             ; ← Branch destination of the BT/S instruction

```

Note: When a delayed branch instruction is used, the branching operation takes place after the slot instruction is executed, but the execution of instructions (register update, etc.) takes place in the sequence delayed branch instruction → delayed slot instruction. For example, even if a delayed slot instruction is used to change the register where the branch destination address is stored, the register content previous to the change will be used as the branch destination address.

6.4.13 CLRMAC Clear MAC register System Control Instruction
MAC Register Clear

| Format | Abstract | Code | Cycle | T Bit |
|---------------|-----------------|------------------|--------------|--------------|
| CLRMAC | 0 → MACH, MACL | 0000000000101000 | 1 | — |

Description

Clear the MACH and MACL Register.

Operation

```
CLRMAC () /* CLRMAC */
{
    MACH=0;
    MACL=0;
    PC+=2;
}
```

Example:

```

| CMP/EQ #imm,R0 | When $R0 = \text{imm}$, $1 \rightarrow T$ | 10001000iiiiiii | 1 | Comparison result |

Description

Compares general register R_n data with R_m data, and sets the T bit to 1 if a specified condition (cond) is satisfied. The T bit is cleared to 0 if the condition is not satisfied. The R_n data does not change. The following eight conditions can be specified. Conditions PZ and PL are the results of comparisons between R_n and 0. Sign-extended 8-bit immediate data can also be compared with $R0$ by using condition EQ. Here, $R0$ data does not change. Table 6.1 shows the mnemonics for the conditions.

Table 6.1 CMP Mnemonics

| Mnemonics | | Condition |
|------------------|---------|---|
| CMP/EQ | Rm,Rn | If $R_n = R_m$, $T = 1$ |
| CMP/GE | Rm,Rn | If $R_n \geq R_m$ with signed data, $T = 1$ |
| CMP/GT | Rm,Rn | If $R_n > R_m$ with signed data, $T = 1$ |
| CMP/HI | Rm,Rn | If $R_n > R_m$ with unsigned data, $T = 1$ |
| CMP/HS | Rm,Rn | If $R_n \geq R_m$ with unsigned data, $T = 1$ |
| CMP/PL | Rn | If $R_n > 0$, $T = 1$ |
| CMP/PZ | Rn | If $R_n \geq 0$, $T = 1$ |
| CMP/STR | Rm,Rn | If a byte in R_n equals a byte in R_m , $T = 1$ |
| CMP/EQ | #imm,R0 | If $R_0 = \text{imm}$, $T = 1$ |

Operation

```

| 6.4.16 | DIV0S Initialization for Signed Division | DIVide (step 0) as Signed | Arithmetic Instruction |
|---------------|---|----------------------------------|-------------------------------|

| Format | Abstract | Code | Cycle | T Bit |
|-------------|--|------------------|-------|--------------------|
| DIV0S Rm,Rn | MSB of Rn → Q, MSB of Rm → M, M^Q → T | 0010nnnnmmmm0111 | 1 | Calculation result |

Description

DIV0S is an initialization instruction for signed division. It finds the quotient by repeatedly dividing in combination with the DIV1 or another instruction that divides for each bit after this instruction. See the description given with DIV1 for more information.

Operation

```

DIV0S(long m, long n)    /* DIV0S Rm,Rn */
{
    if ((R[n]&0x80000000)==0) Q=0;
    else Q=1;
    if ((R[m]&0x80000000)==0) M=0;
    else M=1;
    T=!(M==Q);
    PC+=2;
}

```

Example: See DIV1.

6.4.17 DIV0U DIVide (step 0) as Unsigned Arithmetic Instruction
 Initialization for Unsigned Division

| Format | Abstract | Code | Cycle | T Bit |
|--------|-----------|------------------|-------|-------|
| DIV0U | 0 → M/Q/T | 0000000000011001 | 1 | 0 |

Description

DIV0U is an initialization instruction for unsigned division. It finds the quotient by repeatedly dividing in combination with the DIV1 or another instruction that divides for each bit after this instruction. See the description given with DIV1 for more information.

Operation

```

DIV0U() /* DIV0U */
{
    M=Q=T=0;

|------------|---------------------------|------------------|-------|--------------------|
| DIV1 Rm,Rn | 1 step division (Rn ÷ Rm) | 0011nnnnmmmm0100 | 1 | Calculation result |

Description

Uses single-step division to divide one bit of the 32-bit data in general register Rn (dividend) by Rm data (divisor). It finds a quotient through repetition either independently or used in combination with other instructions. During this repetition, do not rewrite the specified register or the M, Q, and T bits.

In one-step division, the dividend is shifted one bit left, the divisor is subtracted and the quotient bit reflected in the Q bit according to the status (positive or negative). To find the remainder in a division, first find the quotient using a DIV1 instruction, then find the remainder as follows:

$$(\text{dividend}) - (\text{divisor}) \times (\text{quotient}) = (\text{remainder})$$

Zero division, overflow detection, and remainder operation are not supported. Check for zero division and overflow division before dividing.

Find the remainder by first finding the sum of the divisor and the quotient obtained and then subtracting it from the dividend. That is, first initialize with DIV0S or DIV0U. Repeat DIV1 for each bit of the divisor to obtain the quotient. When the quotient requires 17 or more bits, place ROTCL before DIV1. For the division sequence, see the following examples.

Operation

```
DIV1(long m, long n) /* DIV1 Rm, Rn */
{
    unsigned long tmp0;
    unsigned char old_q, tmp1;

    old_q=Q;
    Q=(unsigned char)((0x80000000 & R[n])!=0);
    R[n]<<=1;
    R[n]|=(unsigned long)T;
    switch(old_q){
        case 0:switch(M){
            case 0:tmp0=R[n];
                R[n]-=R[m];
                tmp1=(R[n]>tmp0);
                switch(Q){
                    case 0:Q=tmp1;
                        break;
                    case 1:Q=(unsigned char)(tmp1==0);
                        break;
                }
                break;
            case 1:tmp0=R[n];
                R[n]+=R[m];
                tmp1=(R[n]<tmp0);
                switch(Q){
                    case 0:Q=(unsigned char)(tmp1==0);
                        break;
                    case 1:Q=tmp1;
                        break;
                }
            }
        break;
    }
    break;
}
```

```
case 1:switch(M) {
    case 0:tmp0=R[n];
        R[n]+=R[m];
        tmp1=(R[n]<tmp0);
        switch(Q) {
            case 0:Q=tmp1;
                break;
            case 1:Q=(unsigned char) (tmp1==0);
                break;
        }
        break;
    case 1:tmp0=R[n];
        R[n]-=R[m];
        tmp1=(R[n]>tmp0);
        switch(Q) {
            case 0:Q=(unsigned char) (tmp1==0);
                break;
            case 1:Q=tmp1;
                break;
        }
        break;
    }
    break;
}
T=(Q==M);
PC+=2;
}
```

Example 1:

```

; R1 (32 bits) / R0 (16 bits) = R1 (16 bits):Unsigned
SHLL16    R0          ; Upper 16 bits = divisor, lower 16 bits = 0
TST       R0, R0      ; Zero division check
BT        ZERO_DIV    ;
CMP/HS    R0, R1      ; Overflow check
BT        OVER_DIV    ;
DIV0U                                ; Flag initialization
.arepeat 16          ;
DIV1      R0, R1      ; Repeat 16 times
.aendr                                ;
ROTCL     R1          ;
EXTU.W    R1, R1      ; R1 = Quotient

```

Example 2:

```

; R1:R2 (64 bits)/R0 (32 bits) = R2 (32 bits):Unsigned
TST       R0, R0      ; Zero division check
BT ZERO_DIV                                ;
CMP/HS    R0, R1      ; Overflow check
BT OVER_DIV                                ;
DIV0U                                ; Flag initialization
.arepeat 32          ;
ROTCL     R2          ; Repeat 32 times
DIV1      R0, R1      ;
.aendr                                ;
ROTCL     R2          ; R2 = Quotient

```

Example 3:

```

; R1 (16 bits)/R0 (16 bits) = R1 (16 bits):Signed
SHLL16    R0          ; Upper 16 bits = divisor, lower 16 bits = 0
EXTS.W    R1, R1      ; Sign-extends the dividend to 32 bits
XOR       R2, R2      ; R2 = 0
MOV       R1, R3      ;
ROTCL     R3          ;
SUBC      R2, R1      ; Decrements if the dividend is negative
DIV0S     R0, R1      ; Flag initialization
.arepeat 16          ;
DIV1      R0, R1      ; Repeat 16 times
.aendr
EXTS.W    R1, R1      ;
ROTCL     R1          ; R1 = quotient (one's complement)
ADDC      R2, R1      ; Increments and takes the two's complement if the MSB of the quotient is 1
EXTS.W    R1, R1      ; R1 = quotient (two's complement)

```

Example 4:

```

; R2 (32 bits) / R0 (32 bits) = R2 (32 bits):Signed
MOV       R2, R3      ;
ROTCL     R3          ;
SUBC      R1, R1      ; Sign-extends the dividend to 64 bits (R1:R2)
XOR       R3, R3      ; R3 = 0
SUBC      R3, R2      ; Decrements and takes the one's complement if the dividend is negative
DIV0S     R0, R1      ; Flag initialization
.arepeat 32          ;
ROTCL     R2          ; Repeat 32 times
DIV1      R0, R1      ;
.aendr
ROTCL     R2          ; R2 = Quotient (one's complement)
ADDC      R3, R2      ; Increments and takes the two's complement if the MSB of the quotient is 1.
; R2 = Quotient (two's complement)

```

| | Signed Double-Length Multiplication | | |

| Format | Abstract | Code | Cycle | T Bit |
|----------------|--|------------------|--------------|--------------|
| DMULS.L Rm, Rn | With sign, $Rn \times Rm \rightarrow MACH, MACL$ | 0011nnnnmmmm1101 | 4 | — |

Description

Performs 32-bit multiplication of the contents of general registers Rn and Rm, and stores the 64-bit results in the MACL and MACH register. The operation is a signed arithmetic operation.

Operation

```
DMULS(long m, long n) /* DMULS.L Rm, Rn */
{
    unsigned long RnL, RnH, RmL, RmH, Res0, Res1, Res2;
    unsigned long temp0, temp1, temp2, temp3;
    long tempm, tempn, fnLmL;

    tempn = (long) R[n];
    tempm = (long) R[m];
    if (tempn < 0) tempn = 0 - tempn;
    if (tempm < 0) tempm = 0 - tempm;
    if ((long) (R[n] ^ R[m]) < 0) fnLmL = -1;
    else fnLmL = 0;

    temp1 = (unsigned long) tempn;
    temp2 = (unsigned long) tempm;

    RnL = temp1 & 0x0000FFFF;
    RnH = (temp1 >> 16) & 0x0000FFFF;
    RmL = temp2 & 0x0000FFFF;
    RmH = (temp2 >> 16) & 0x0000FFFF;
```

```

temp0=RmL*RnL;
temp1=RmH*RnL;
temp2=RmL*RnH;
temp3=RmH*RnH;

Res2=0
Res1=temp1+temp2;
if (Res1<temp1) Res2+=0x00010000;

temp1=(Res1<<16) &0xFFFF0000;
Res0=temp0+temp1;
if (Res0<temp0) Res2++;

Res2=Res2+((Res1>>16) &0x0000FFFF)+temp3;

if (fnLmL<0) {
    Res2=~Res2;
    if (Res0==0)
        Res2++;
    else
        Res0=(~Res0)+1;
}
MACH=Res2;
MACL=Res0;
PC+=2;
}

```

Example:

```

DMULS.L R0,R1    ; Before execution:  R0 = H'FFFFFFFE, R1 = H'00005555
                  ; After execution:   MACH = H'FFFFFFF, MACL = H'FFFF5556
STS    MACH,R0   ; Operation result (top)
STS    MACL,R0   ; Operation result (bottom)

```

6.4.21 DT Decrement and Test Arithmetic Instruction
 Decrement and Test

| Format | Abstract | Code | Cycle | T Bit |
|--------|---|------------------|-------|-------------------|
| DT Rn | Rn - 1 → Rn; When Rn is 0, 1 → T, when Rn is nonzero, 0 → T | 0100nnnn00010000 | 1 | Comparison result |

Description

The contents of general register Rn are decremented by 1 and the result compared to 0 (zero). When the result is 0, the T bit is set to 1. When the result is not zero, the T bit is set to 0.

Operation

```
DT(long n) /* DT Rn */
{
    R[n]--;
    if (R[n]==0) T=1;
    else T=0;
    PC+=2;
}
```

Example:

```
MOV #4,R5 ; Sets the number of loops.
LOOP:
ADD R0,R1 ;
DT R5 ; Decrements the R5 value and checks whether it has become 0.
BF LOOP ; Branches to LOOP if T=0. (In this example, loops 4 times.)
```

6.4.22 EXTS EXTend as Signed Arithmetic Instruction

Sign Extension

| Format | Abstract | Code | Cycle | T Bit |
|---------------|-------------------------------|------------------|-------|-------|
| EXTS.B Rm, Rn | Sign-extend Rm from byte → Rn | 0110nnnnmmmm1110 | 1 | — |
| EXTS.W Rm, Rn | Sign-extend Rm from word → Rn | 0110nnnnmmmm1111 | 1 | — |

Description

Sign-extends general register Rm data, and stores the result in Rn. If byte length is specified, the bit 7 value of Rm is copied into bits 8 to 31 of Rn. If word length is specified, the bit 15 value of Rm is copied into bits 16 to 31 of Rn.

Operation

```
EXTSB(long m, long n)      /* EXTS.B Rm, Rn */
{
    R[n]=R[m];
    if ((R[m]&0x00000080)==0) R[n]&=0x000000FF;
    else R[n]|=0xFFFFF00;
    PC+=2;
}
EXTSW(long m, long n)     /* EXTS.W Rm, Rn */
{
    R[n]=R[m];
    if ((R[m]&0x00008000)==0) R[n]&=0x0000FFFF;
    else R[n]|=0xFFFF0000;
    PC+=2;
}
```

Examples:

```
EXTS.B R0, R1      ; Before execution: R0 = H'00000080
                   ; After execution:  R1 = H'FFFFFF80

EXTS.W R0, R1      ; Before execution: R0 = H'00008000
                   ; After execution:  R1 = H'FFFF8000
```

6.4.23 EXTU EXTend as Unsigned Arithmetic Instruction

Zero Extension

| Format | Abstract | Code | Cycle | T Bit |
|---------------|-------------------------------|--------------------|-------|-------|
| EXTU.B Rm, Rn | Zero-extend Rm from byte → Rn | 0110nnnnnnmmmm1100 | 1 | — |
| EXTU.W Rm, Rn | Zero-extend Rm from word → Rn | 0110nnnnnnmmmm1101 | 1 | — |

Description

Zero-extends general register Rm data, and stores the result in Rn. If byte length is specified, 0s are written in bits 8 to 31 of Rn. If word length is specified, 0s are written in bits 16 to 31 of Rn.

Operation

```
EXTUB(long m, long n) /* EXTU.B Rm, Rn */
```

```
{
    R[n]=R[m];
    R[n]&=0x000000FF;
    PC+=2;
}
```

```
EXTUW(long m, long n) /* EXTU.W Rm, Rn */
```

```
{
    R[n]=R[m];
    R[n]&=0x0000FFFF;
    PC+=2;
}
```

Examples:

```
EXTU.B R0, R1 ; Before execution: R0 = H'FFFFFF80
               ; After execution:  R1 = H'00000080
EXTU.W R0, R1 ; Before execution: R0 = H'FFFF8000
               ; After execution:  R1 = H'00008000
```

| 6.4.24 | JMP | JuMP | Branch Instruction | | |
|---------|----------------------|-------------|----------------------------|-------|-------|
| | Unconditional Branch | | Delayed Branch Instruction | | |
| Format | Abstract | | Code | Cycle | T Bit |
| JMP @Rm | Rm → PC | | 0100mmmm00101011 | 2 | — |

Description

Branches unconditionally to the address specified by register indirect addressing. The branch destination is an address specified by the 32-bit data in general register Rm.

Note

Since this is a delayed branch instruction, the instruction after JMP is executed before branching. No interrupts or address errors are accepted between this instruction and the next instruction. If the next instruction is a branch instruction, it is acknowledged as an illegal slot instruction.

Operation

```
JMP (long m) /* JMP @Rm */
{
    unsigned long temp;

    temp=PC;
    PC=R[m]+4;
    Delay_Slot(temp+2);
}
```

Example:

```
MOV.L    JMP_TABLE, R0    ; Address of R0 = TRGET
JMP      @R0              ; Branches to TRGET
MOV      R0, R1           ; Executes MOV before branching
        .align    4
JMP_TABLE: .data.l  TRGET    ; Jump table
        .....
TRGET:    ADD      #1, R1    ; ← Branch destination
```

Note: When a delayed branch instruction is used, the branching operation takes place after the slot instruction is executed, but the execution of instructions (register update, etc.) takes place in the sequence delayed branch instruction → delayed slot instruction. For example, even if a delayed slot instruction is used to change the register where the branch destination address is stored, the register content previous to the change will be used as the branch destination address.

| 6.4.25 | JSR | Jump to SubRoutine | Branch Instruction | | |
|--------|-----|--------------------------------|----------------------------|-------|-------|
| | | Branch to Subroutine Procedure | Delayed Branch Instruction | | |
| Format | | Abstract | Code | Cycle | T Bit |
| JSR | @Rm | PC → PR, Rm → PC | 0100mmmm00001011 | 2 | — |

Description

Branches to the subroutine procedure at the address specified by register indirect addressing. The PC value is stored in the PR. The jump destination is an address specified by the 32-bit data in general register Rm. The stored/saved PC is the address four bytes after this instruction. The JSR instruction and RTS instruction are used together for subroutine procedure calls.

Note

Since this is a delayed branch instruction, the instruction after JSR is executed before branching. No interrupts and address errors are accepted between this instruction and the next instruction. If the next instruction is a branch instruction, it is acknowledged as an illegal slot instruction.

Operation

```
JSR(long m) /* JSR @Rm */
{
    PR=PC;
    PC=R[m]+4;
    Delay_Slot(PR+2);
}
```

Example:

```

MOV.L   JSR_TABLE, R0    ; Address of R0 = TRGET
JSR     @R0              ; Branches to TRGET
XOR     R1, R1           ; Executes XOR before branching
ADD     R0, R1           ; ← Return address for when the subroutine procedure
                        ; is completed (PR data)

.....
.align  4
JSR_TABLE: .data.l TRGET ; Jump table
TRGET:    NOP           ; ← Procedure entrance
          MOV          R2, R3 ;
          RTS          ; Returns to the above ADD instruction
          MOV          #70, R1 ; Executes MOV before RTS

```

Note: When a delayed branch instruction is used, the branching operation takes place after the slot instruction is executed, but the execution of instructions (register update, etc.) takes place in the sequence delayed branch instruction → delayed slot instruction. For example, even if a delayed slot instruction is used to change the register where the branch destination address is stored, the register content previous to the change will be used as the branch destination address.

6.4.26 LDC Load to Control Register System Control Instruction

| Format | | Abstract | Code | Cycle | T Bit |
|--------|----------|-------------------------|------------------|-------|-------|
| LDC | Rm,SR | Rm → SR | 0100mmmm00001110 | 3 | LSB |
| LDC | Rm,GBR | Rm → GBR | 0100mmmm00011110 | 1 | — |
| LDC | Rm,VBR | Rm → VBR | 0100mmmm00101110 | 1 | — |
| LDC.L | @Rm+,SR | (Rm) → SR, Rm + 4 → Rm | 0100mmmm00000111 | 5 | LSB |
| LDC.L | @Rm+,GBR | (Rm) → GBR, Rm + 4 → Rm | 0100mmmm00010111 | 1 | — |
| LDC.L | @Rm+,VBR | (Rm) → VBR, Rm + 4 → Rm | 0100mmmm00100111 | 1 | — |

Description

Store the source operand into control register SR, GBR, or VBR.

Operation

```
LDCSR(long m) /* LDC Rm,SR */
{
    SR=R[m]&0x000063F3;
    PC+=2;
}
LDCGBR(long m) /* LDC Rm,GBR */
{
    GBR=R[m];
    PC+=2;
}
LDCVBR(long m) /* LDC Rm,VBR */
{
    VBR=R[m];
    PC+=2;
}
LDCMSR(long m) /* LDC.L @Rm+,SR */
{
    SR=Read_Long(R[m])&0x000063F3;
```

```
R[m] +=4;
PC +=2;
}
LDCMGBR(long m) /* LDC.L @Rm+,GBR */
{
    GBR=Read_Long(R[m]);
    R[m] +=4;
    PC +=2;
}
LDCMVBR(long m) /* LDC.L @Rm+,VBR */
{
    VBR=Read_Long(R[m]);
    R[m] +=4;
    PC +=2;
}
```

Examples:

```
LDC    R0,SR      ; Before execution: R0 = H'FFFFFFFF, SR = H'00000000
          ; After execution:   SR = H'000063F3
```

```
LDC.L  @R15+,GBR ; Before execution: R15 = H'10000000
          ; After execution:   R15 = H'10000004, GBR = @H'10000000
```

6.4.27 LDS Load to System Register System Control Instruction

Load to System Register

| Format | Abstract | Code | Cycle | T Bit |
|------------------|--------------------------|------------------|-------|-------|
| LDS Rm,MACH | Rm → MACH | 0100mmmm00001010 | 1 | — |
| LDS Rm,MACL | Rm → MACL | 0100mmmm00011010 | 1 | — |
| LDS Rm,PR | Rm → PR | 0100mmmm00101010 | 1 | — |
| LDS.L @Rm+, MACH | (Rm) → MACH, Rm + 4 → Rm | 0100mmmm00000110 | 1 | — |

| LDS.L @Rm+,PR | (Rm) → PR, Rm + 4 → Rm | 0100mmmm00100110 | 1 | — |

Description

Store the source operand into the system register MACH, MACL, or PR.

Operation

```

LDSMACH(long m)          /* LDS Rm,MACH */
{
    MACH=R[m];
    PC+=2;
}
LDSMACL(long m)          /* LDS Rm,MACL */
{
    MACL=R[m];
    PC+=2;
}
LDSPR(long m)            /* LDS Rm,PR */
{
    PR=R[m];
    PC+=2;
}
LDSMMACH(long m)         /* LDS.L @Rm+,MACH */
{
    MACH=Read_Long(R[m]);

```

```
    R[m] += 4;
    PC += 2;
}
LDSMMACL(long m)      /* LDS.L @Rm+, MACL */
{
    MACL = Read_Long(R[m]);
    R[m] += 4;
    PC += 2;
}
LDSMPR(long m)       /* LDS.L @Rm+, PR */
{
    PR = Read_Long(R[m]);
    R[m] += 4;
    PC += 2;
}
```

Examples:

| | | | |
|-------|-------------|---------------------|--------------------------------------|
| LDS | R0, PR | ; Before execution: | R0 = H'12345678, PR = H'00000000 |
| | | ; After execution: | PR = H'12345678 |
| LDS.L | @R15+, MACL | ; Before execution: | R15 = H'10000000 |
| | | ; After execution: | R15 = H'10000004, MACL = @H'10000000 |

| 6.4.28 MAC.L | Multiply and ACcumulate | Long | Arithmetic Instruction |
| | Double-Precision Multiply-and-Accumulate Operation | | |

| Format | Abstract | Code | Cycle | T Bit |
|------------------|---|------------------|-------|-------|
| MAC.L @Rm+, @Rn+ | Signed operation, $(Rn) \times (Rm) + MAC \rightarrow MAC$ | 0000nnnnmmmm1111 | 4 | — |

Description

Does signed multiplication of 32-bit operands obtained using the contents of general registers Rm and Rn as addresses. The 64-bit result is added to contents of the MAC register, and the final result is stored in the MAC register. Every time an operand is read, they increment Rm and Rn by four.

When the S bit is cleared to 0, the 64-bit result is stored in the coupled MACH and MACL registers. When bit S is set to 1, addition to the MAC register is a saturation operation of 48 bits starting from the LSB. For the saturation operation, only the lower 48 bits of the MACL register are enabled and the result is limited to a range of H'FFFF800000000000 (minimum) and H'00007FFFFFFF (maximum).

Operation

```
MACL(long m, long n) /* MAC.L @Rm+, @Rn+ */
{
    unsigned long RnL, RnH, RmL, RmH, Res0, Res1, Res2;
    unsigned long temp0, temp1, temp2, temp3;
    long tempm, tempn, fnLmL;

    tempn = (long) Read_Long (R[n]);
    R[n] += 4;
    tempm = (long) Read_Long (R[m]);
    R[m] += 4;

    if ((long) (tempn ^ tempm) < 0) fnLmL = -1;
    else fnLmL = 0;
}
```

```
if (tempn<0) tempn=0-tempn;
```

```
if (tempm<0) tempm=0-tempm;
```

```

| 6.4.29 | MAC.W | Multiply and ACcumulate Word | Arithmetic Instruction |
| | | | |

| Format | Abstract | Code | Cycle | T Bit |
|------------------|--|------------------|-------|-------|
| MAC.W @Rm+, @Rn+ | With sign, $(Rn) \times (Rm) + MAC \rightarrow MAC$ | 0100nnnnmmmm1111 | 3 | — |
| MAC @Rm+, @Rn+ | | | | |

Description

Does signed multiplication of 16-bit operands obtained using the contents of general registers Rm and Rn as addresses. The 32-bit result is added to contents of the MAC register, and the final result is stored in the MAC register. Rm and Rn data are incremented by 2 after the operation.

When the S bit is cleared to 0, the operation is $16 \times 16 + 64 \rightarrow 64$ -bit multiply and accumulate and the 64-bit result is stored in the coupled MACH and MACL registers.

When the S bit is set to 1, the operation is $16 \times 16 + 32 \rightarrow 32$ -bit multiply and accumulate and addition to the MAC register is a saturation operation. For the saturation operation, only the MACL register is enabled and the result is limited to a range of H'80000000 (minimum) and H'7FFFFFFF (maximum).

If an overflow occurs, the MACH register is set to H'00000001. The result is stored in the MACL register. The result is limited to a value between H'80000000 (minimum) for overflows in the negative direction and H'7FFFFFFF (maximum) for overflows in the positive direction.

Operation

```
MACW(long m, long n) /* MAC.W @Rm+, @Rn+ */
{
    long tempm, tempn, dest, src, ans;
    unsigned long templ;
    tempn = (long) Read_Word(R[n]);
    R[n] += 2;
    tempm = (long) Read_Word(R[m]);
    R[m] += 2;
}
```

```
templ=MACL;
tempm=((long)(short)tempn*(long)(short)tempm);
if ((long)MACL>=0) dest=0;
else dest=1;
if ((long)tempm>=0 {
    src=0;
    tempn=0;
}
else {
    src=1;
    tempn=0xFFFFFFFF;
}
src+=dest;

Description

Transfers the source operand to the destination. When the operand is stored in memory, the transferred data can be a byte, word, or longword. Loaded data from memory is stored in a register after it is sign-extended to a longword.

Operation

```

MOV(long m, long n)      /* MOV Rm, Rn */
{
    R[n]=R[m];
    PC+=2;
}

6.4.31 MOV **MOVE immediate data** **Data Transfer Instruction**
 Immediate Data
 Transfer

| Format | Abstract | Code | Cycle | T Bit |
|----------------------|---------------------------------------|-----------------|-------|-------|
| MOV #imm,Rn | imm → sign extension → Rn | 1110nnnniiiiiii | 1 | — |
| MOV.W @(disp, PC),Rn | (disp × 2 + PC) → sign extension → Rn | 1001nnnnddddddd | 1 | — |
| MOV.L @(disp, PC),Rn | (disp × 4 + PC) → Rn | 1101nnnnddddddd | 1 | — |

Description

Stores immediate data, which has been sign-extended to a longword, into general register Rn.

If the data is a word or longword, table data stored in the address specified by PC + displacement is accessed. If the data is a word, the 8-bit displacement is zero-extended and doubled.

Consequently, the relative interval from the table can be up to PC + 510 bytes. The PC points to the starting address of the fourth byte after this MOV instruction. If the data is a longword, the 8-bit displacement is zero-extended and quadrupled. Consequently, the relative interval from the table can be up to PC + 1020 bytes. The PC points to the starting address of the fourth byte after this MOV instruction, but the lowest two bits of the PC are corrected to B'00.

Note

The optimum table assignment is at the rear end of the module or one instruction after the unconditional branch instruction. If the optimum assignment is impossible for the reason of no unconditional branch instruction in the 510 byte/1020 byte or some other reason, means to jump past the table by the BRA instruction are required. By assigning this instruction immediately after the delayed branch instruction, the PC becomes the "first address + 2".

For the Renesas Technology Super H RISC engine assembler, declarations should use scaled values (×2, ×4) as displacement values.

Operation

```
MOVI(long i,long n)      /* MOV #imm,Rn */
{
    if ((i&0x80)==0) R[n]=(0x000000FF & (long)i);
    else R[n]=(0xFFFFFFFF00 | (long)i);
    PC+=2;
}

MOVWI(long d,long n)     /* MOV.W @(disp,PC),Rn */
{
    long disp;

    disp=(0x000000FF & (long)d);
    R[n]=(long)Read_Word(PC+(disp<<1));
    if ((R[n]&0x8000)==0) R[n]&=0x0000FFFF;
    else R[n]|=0xFFFF0000;
    PC+=2;
}

MOVLI(long d,long n)     /* MOV.L @(disp,PC),Rn */
{
    long disp;

    disp=(0x000000FF & (long)d);
    R[n]=Read_Long((PC&0xFFFFFFF0)+(disp<<2));
    PC+=2;
}
```

Example:

6.4.32 MOV MOVE peripheral Data Data Transfer Instruction

Peripheral Module
Data Transfer

| Format | Abstract | Code | Cycle | T Bit |
|----------------------|--|------------------|-------|-------|
| MOV.B @(disp,GBR),R0 | (disp + GBR) → sign extension → R0 | 11000100dddddddd | 1 | — |
| MOV.W @(disp,GBR),R0 | (disp × 2 + GBR) → sign extension → R0 | 11000101dddddddd | 1 | — |
| MOV.L @(disp,GBR),R0 | (disp × 4 + GBR) → R0 | 11000110dddddddd | 1 | — |
| MOV.B R0,@(disp,GBR) | R0 → (disp + GBR) | 11000000dddddddd | 1 | — |
| MOV.W R0,@(disp,GBR) | R0 → (disp × 2 + GBR) | 11000001dddddddd | 1 | — |
| MOV.L R0,@(disp,GBR) | R0 → (disp × 4 + GBR) | 11000010dddddddd | 1 | — |

Description

Transfers the source operand to the destination. This instruction is optimum for accessing data in the peripheral module area. The data can be a byte, word, or longword, but only the R0 register can be used.

A peripheral module base address is set to the GBR. When the peripheral module data is a byte, the only change made is to zero-extend the 8-bit displacement. Consequently, an address within +255 bytes can be specified. When the peripheral module data is a word, the 8-bit displacement is zero-extended and doubled. Consequently, an address within +510 bytes can be specified. When the peripheral module data is a longword, the 8-bit displacement is zero-extended and is quadrupled. Consequently, an address within +1020 bytes can be specified. If the displacement is too short to reach the memory operand, the above @(R0,Rn) mode must be used after the GBR data is transferred to a general register. When the source operand is in memory, the loaded data is stored in the register after it is sign-extended to a longword.

Note

The destination register of a data load is always R0. R0 cannot be accessed by the next instruction until the load instruction is finished. The instruction order shown in figure 6.1 will give better results.

| | | |
|----------------------|---|----------------------|
| MOV.B @(12, GBR), R0 | | MOV.B @(12, GBR), R0 |
| AND #80, R0 | → | ADD #20, R1 |
| ADD #20, R1 | → | AND #80, R0 |

Figure 6.1 Using R0 after MOV

For the Renesas Technology Super H RISC engine assembler, declarations should use scaled values ($\times 1$, $\times 2$, $\times 4$) as displacement values.

Operation

```

MOVBLG(long d)    /* MOV.B @(disp,GBR),R0 */
{
    long disp;

    disp=(0x000000FF & (long)d);
    R[0]=(long)Read_Byte(GBR+disp);
    if ((R[0]&0x80)==0) R[0]&=0x000000FF;
    else R[0]|=0xFFFFFFFF0;
    PC+=2;
}

MOVWLG(long d)    /* MOV.W @(disp,GBR),R0 */
{
    long disp;

    PC+=2;
}
```

Examples:

```
MOV.L @(2,GBR),R0 ; Before execution: @(GBR + 8) = H'12345670
                ; After execution: R0 = H'12345670

MOV.B R0,@(1,GBR) ; Before execution: R0 = H'FFFF7F80
                ; After execution: @(GBR + 1) = H'FFFF7F80
```

6.4.33 MOV MOVE structure data Data Transfer Instruction

Structure Data Transfer

| Format | Abstract | Code | Cycle | T Bit |
|---------------------|---------------------------------------|------------------|-------|-------|
| MOV.B R0,@(disp,Rn) | R0 → (disp + Rn) | 10000000nnnndddd | 1 | — |
| MOV.W R0,@(disp,Rn) | R0 → (disp × 2 + Rn) | 10000001nnnndddd | 1 | — |
| MOV.L Rm,@(disp,Rn) | Rm → (disp × 4 + Rn) | 0001nnnnmmmmdddd | 1 | — |
| MOV.B @(disp,Rm),R0 | (disp + Rm) → sign extension → R0 | 10000100mmmmdddd | 1 | — |
| MOV.W @(disp,Rm),R0 | (disp × 2 + Rm) → sign extension → R0 | 10000101mmmmdddd | 1 | — |
| MOV.L @(disp,Rm),Rn | disp × 4 + Rm) → Rn | 0101nnnnmmmmdddd | 1 | — |

Description

Transfers the source operand to the destination. This instruction is optimum for accessing data in a structure or a stack. The data can be a byte, word, or longword, but when a byte or word is selected, only the R0 register can be used. When the data is a byte, the only change made is to zero-extend the 4-bit displacement. Consequently, an address within +15 bytes can be specified. When the data is a word, the 4-bit displacement is zero-extended and doubled. Consequently, an address within +30 bytes can be specified. When the data is a longword, the 4-bit displacement is zero-extended and quadrupled. Consequently, an address within +60 bytes can be specified. If the displacement is too short to reach the memory operand, the aforementioned @(R0,Rn) mode must be used. When the source operand is in memory, the loaded data is stored in the register after it is sign-extended to a longword.

Note

When byte or word data is loaded, the destination register is always R0. R0 cannot be accessed by the next instruction until the load instruction is finished. The instruction order in figure 6.2 will give better results.

|--------------------|---|--------------------|
| MOV.B @(2, R1), R0 | | MOV.B @(2, R1), R0 |
| AND #80, R0 | → | ADD #20, R1 |
| ADD #20, R1 | → | AND #80, R0 |

Figure 6.2 Using R0 after MOV

For the Renesas Technology SuperH RISC engine assembler, declarations should use scaled values (×1, ×2, ×4) as displacement values.

Operation

```
MOVBS4(long d,long n) /* MOV.B R0,@(disp,Rn) */
{
    long disp;

    disp=(0x0000000F & (long)d);
    Write_Byte(R[n]+disp,R[0]);
    PC+=2;
}

MOVWS4(long d,long n) /* MOV.W R0,@(disp,Rn) */
{
    long disp;

    disp=(0x0000000F & (long)d);
    Write_Word(R[n]+(disp<<1),R[0]);
    PC+=2;
}

MOVLS4(long m,long d,long n) /* MOV.L Rm,@(disp,Rn) */
{
    long disp;

    disp=(0x0000000F & (long)d);
    Write_Long(R[n]+(disp<<2),R[m]);
    PC+=2;
}

MOVBL4(long m,long d) /* MOV.B @(disp,Rm),R0 */
{
    long disp;

    disp=(0x0000000F & (long)d);
    R[0]=Read_Byte(R[m]+disp);
    if ((R[0]&0x80)==0) R[0]&=0x000000FF;
    else R[0]|=0xFFFFFFFF;
    PC+=2;
}
```

```

MOVWL4(long m,long d) /* MOV.W @(disp,Rm),R0 */
{
    long disp;

    disp=(0x0000000F & (long)d);
    R[0]=Read_Word(R[m]+(disp<<1));
    if ((R[0]&0x8000)==0) R[0]&=0x0000FFFF;
    else R[0]|=0xFFFF0000;
    PC+=2;
}
MOVLL4(long m,long d,long n)
/* MOV.L @(disp,Rm),Rn */
{
    long disp;

    disp=(0x0000000F & (long)d);
    R[n]=Read_Long(R[m]+(disp<<2));
    PC+=2;
}

```

Examples:

```

MOV.L @(2,R0),R1 ; Before execution: @(R0 + 8) = H'12345670
                ; After execution: R1 = H'12345670
MOV.L R0,@(H'F,R1) ; Before execution: R0 = H'FFFF7F80
                ; After execution: @(R1 + 60) = H'FFFF7F80

```

| | | | |
|---------------|--|-------------------------------|----------------------------------|
| 6.4.34 | MOVA Effective Address Transfer | MOVE effective Address | Data Transfer Instruction |
|---------------|--|-------------------------------|----------------------------------|

| Format | Abstract | Code | Cycle | T Bit |
|---------------------|--------------------|------------------|-------|-------|
| MOVA @ (disp,PC),R0 | disp × 4 + PC → R0 | 11000111dddddddd | 1 | — |

Description

Stores the effective address of the source operand into general register R0. The 8-bit displacement is zero-extended and quadrupled. Consequently, the relative interval from the operand is PC + 1020 bytes. The PC is the address four bytes after this instruction, but the lowest two bits of the PC are corrected to B'00.

Note

If this instruction is placed immediately after a delayed branch instruction, the PC must point to an address specified by (the starting address of the branch destination) + 2.

For the Renesas Technology Super H RISC engine assembler, declarations should use scaled values (×4) as displacement values.

Operation

```
MOVA(long d) /* MOVA @(disp,PC),R0 */
{
    long disp;

    disp=(0x000000FF & (long)d);
    R[0]=(PC&0xFFFFF0)+ (disp<<2);
    PC+=2;
}
```

Example:

```

Address  .org  H'1006
1006      MOVA  STR, R0      ; Address of STR → R0
1008      MOV.B @R0, R1     ; R1 = "X" ← PC location after correcting the lowest two bits
100A      ADD   R4, R5      ; ← Original PC location for address calculation for the
                          MOVA instruction

                          .align 4
100C  STR:  .sdata "XYZP12"
.....
2002      BRA   TRGET       ; Delayed branch instruction
2004      MOVA @ (0, PC), R0 ; Address of TRGET + 2 → R0
2006      NOP   ;

```

6.4.35 MOV T bit **Data Transfer Instruction**
 T Bit Transfer

| Format | Abstract | Code | Cycle | T Bit |
|----------|----------|------------------|-------|-------|
| MOV T Rn | T → Rn | 0000n00000101001 | 1 | — |

Description

Stores the T bit value into general register Rn. When T = 1, 1 is stored in Rn, and when T = 0, 0 is stored in Rn.

Operation

```
MOV T (long n) /* MOV T Rn */
{
  R[n] = (0x00000001 & SR);
  PC += 2;
}
```

Example:

```
XOR    R2, R2    ;R2 = 0
CMP/PZ R2      ;T = 1
MOV T   R0      ;R0 = 1
CLRT                    ;T = 0
MOV T   R1      ;R1 = 0
```

| | | | |

|-------------|---------------------------------|------------------|-------|-------|
| MUL.L Rm,Rn | $Rn \times Rm \rightarrow MACL$ | 0000nnnnmmmm0111 | 2 | — |

Description

Performs 32-bit multiplication of the contents of general registers Rn and Rm, and stores the bottom 32 bits of the result in the MACL register. The MACH register data does not change.

Operation

```
MUL.L(long m, long n) /* MUL.L Rm, Rn */
{
    MACL=R[n]*R[m];
    PC+=2;
}
```

Example:

```
MULL R0, R1 ; Before execution: R0 = H'FFFFFFFE, R1 = H'00005555
           ; After execution:  MACL = H'FFFF5556
STS  MACL, R0 ; Operation result
```

| | | | |

| Format | Abstract | Code | Cycle | T Bit |
|--------------|---|-------------------|-------|-------|
| MULS.W Rm,Rn | Signed operation, $Rn \times Rm \rightarrow MACL$ | 0010nnnnnmmmm1111 | 1 | — |
| MULS Rm,Rn | | | | |

Description

Performs 16-bit multiplication of the contents of general registers Rn and Rm, and stores the 32-bit result in the MACL register. The operation is signed and the MACH register data does not change.

Operation

```
MULS(long m, long n) /* MULS Rm, Rn */
{
    MACL = ((long) (short) R[n] * (long) (short) R[m]);
    PC += 2;
}
```

Example:

```
MULS R0, R1 ; Before execution: R0 = H'FFFFFFFE, R1 = H'00005555
           ; After execution:   MACL = H'FFFF5556
STS MACL, R0 ; Operation result
```

6.4.38 MULU.W MULtiply as Unsigned Word Arithmetic Instruction

Unsigned Multiplication

| Format | Abstract | Code | Cycle | T Bit |
|--------------|---|------------------|-------|-------|
| MULU.W Rm,Rn | Unsigned, $Rn \times Rm \rightarrow MACL$ | 0010nnnnmmmm1110 | 1 | — |
| MULU Rm,Rn | | | | |

Description

Performs 16-bit multiplication of the contents of general registers Rn and Rm, and stores the 32-bit result in the MACL register. The operation is unsigned and the MACH register data does not change.

Operation

```
MULU(long m, long n) /* MULU Rm, Rn */
{
    MACL = ((unsigned long) (unsigned short) R[n]
            * (unsigned long) (unsigned short) R[m]);
    PC += 2;
}
```

Example:

```
MULU R0, R1 ; Before execution: R0 = H'00000002, R1 = H'FFFFFFAA
; After execution: MACL = H'00015554
STS MACL, R0 ; Operation result
```

|---------------|------------------------------|---------------|-------------------------------|
| 6.4.39 | NEG Sign Inversion | NEGate | Arithmetic Instruction |
|---------------|------------------------------|---------------|-------------------------------|

| Format | Abstract | Code | Cycle | T Bit |
|-----------|-------------|------------------|-------|-------|
| NEG Rm,Rn | 0 – Rm → Rn | 0110nnnnmmmm1011 | 1 | — |

Description

Takes the two's complement of data in general register Rm, and stores the result in Rn. This effectively subtracts Rm data from 0, and stores the result in Rn.

Operation

```
NEG(long m, long n) /* NEG Rm,Rn */
{
    R[n]=0-R[m];
    PC+=2;
}
```

Example:

```
NEG R0,R1 ; Before execution: R0 = H'00000001
           ; After execution:  R1 = H'FFFFFFF
```

| | | | |

| 6.4.40 | NEGC | NEGate with Carry | Arithmetic Instruction |
| | Sign Inversion with Borrow | | |

| Format | Abstract | Code | Cycle | T Bit |
|------------|-----------------------------|------------------|-------|--------|
| NEGC Rm,Rn | 0 – Rm – T → Rn, Borrow → T | 0110nnnnmmmm1010 | 1 | Borrow |

Description

Subtracts general register Rm data and the T bit from 0, and stores the result in Rn. If a borrow is generated, T bit changes accordingly. This instruction is used for inverting the sign of a value that has more than 32 bits.

Operation

```

NEGC(long m, long n) /* NEGC Rm,Rn */
{
    unsigned long temp;

    temp=0-R[m];
    R[n]=temp-T;
    if (0<temp) T=1;
    else T=0;
    if (temp<R[n]) T=1;
    PC+=2;
}

```

Examples:

```

CLRT          ; Sign inversion of R1 and R0 (64 bits)
NEGC  R1, R1  ; Before execution: R1 = H'00000001, T = 0
           ; After execution:   R1 = H'FFFFFFFF, T = 1
NEGC  R0, R0  ; Before execution: R0 = H'00000000, T = 1
           ; After execution:   R0 = H'FFFFFFFF, T = 1

```

| 6.4.41 | NOP | No OPeration | System Control Instruction |
| | No Operation | | |

| Format | Abstract | Code | Cycle | T Bit |
|---------------|-----------------|------------------|--------------|--------------|
| NOP | No operation | 0000000000001001 | 1 | — |

Description

Increments the PC to execute the next instruction.

Operation

```
NOP () /* NOP */  
{  
    PC+=2;  
}
```

Example:

NOP ; Executes in one cycle

| | | | |
|---------------|-----------------------------|-------------------------------|----------------------------|
| 6.4.42 | NOT Bit Inversion | NOT-logical complement | Logical Instruction |
|---------------|-----------------------------|-------------------------------|----------------------------|

| Format | Abstract | Code | Cycle | T Bit |
|-----------|----------|------------------|-------|-------|
| NOT Rm,Rn | ~Rm → Rn | 0110nnnnmmmm0111 | 1 | — |

Description

Takes the one's complement of general register Rm data, and stores the result in Rn. This effectively inverts each bit of Rm data and stores the result in Rn.

Operation

```
NOT(long m, long n) /* NOT Rm,Rn */
{
    R[n]=~R[m];
    PC+=2;
}
```

Example:

```
NOT    R0,R1 ; Before execution: R0 = H'AAAAAAAA
        ; After execution:   R1 = H'55555555
```

6.4.43 OR OR logical Logical Instruction

Logical OR

| Format | Abstract | Code | Cycle | T Bit |
|---------------------|-------------------------------|------------------|-------|-------|
| OR Rm,Rn | Rn Rm → Rn | 0010nnnnmmmm1011 | 1 | — |
| OR #imm,R0 | R0 imm → R0 | 11001011iiiiiiii | 1 | — |
| OR.B #imm,@(R0,GBR) | (R0 + GBR) imm → (R0 + GBR) | 11001111iiiiiiii | 3 | — |

Description

Logically ORs the contents of general registers Rn and Rm, and stores the result in Rn. The contents of general register R0 can also be ORed with zero-extended 8-bit immediate data, or 8-bit memory data accessed by using indirect indexed GBR addressing can be ORed with 8-bit immediate data.

Operation

```
OR(long m,long n) /* OR Rm,Rn */
{
    R[n] |=R[m];
    PC+=2;
}
ORI(long i) /* OR #imm,R0 */
{
    R[0] |= (0x000000FF & (long)i);
    PC+=2;
}
ORM(long i) /* OR.B #imm,@(R0,GBR) */
{
    long temp;

    temp=(long)Read_Byte(GBR+R[0]);
    temp|= (0x000000FF & (long)i);
    Write_Byte(GBR+R[0],temp);
    PC+=2;
}
```

Examples:

```
OR      R0,R1          ; Before execution: R0 = H'AAAA5555, R1 = H'55550000
                          ; After execution: R1 = H'FFFF5555
OR      #H'F0,R0      ; Before execution: R0 = H'00000008
                          ; After execution: R0 = H'000000F8
OR.B    #H'50,@(R0,GBR) ; Before execution: @(R0,GBR) = H'A5
                          ; After execution: @(R0,GBR) = H'F5
```

        ; After execution: R0 = H'80000000, T = 1
```

| | | | |
|---------------|--|------------------------------|---|
| 6.4.48 | RTE Return from Exception Handling | ReTurn from Exception | System Control Instruction Delayed Branch Instruction |
|---------------|--|------------------------------|---|

| Format | Abstract | Code | Cycle | T Bit |
|--------|------------------------------------|------------------|-------|-------|
| RTE | Delayed branch, Stack area → PC/SR | 0000000000101011 | 4 | LSB |

Description

Returns from an interrupt routine. The PC and SR values are restored from the stack, and the program continues from the address specified by the restored PC value. The T bit is used as the LSB bit in the SR register restored from the stack area.

Note

Since this is a delayed branch instruction, the instruction after this RTE is executed before branching. No address errors and interrupts are accepted between this instruction and the next instruction. If the next instruction is a branch instruction, it is acknowledged as an illegal slot instruction.

Operation

```
RTE() /* RTE */
{
    unsigned long temp;

    temp=PC;
    PC=Read_Long(R[15])+4;
    R[15]+=4;
    SR=Read_Long(R[15])&0x000063F3;
    R[15]+=4;
    Delay_Slot(temp+2);
}
```

Example:

```
RTE          ; Returns to the original routine
ADD #8, R14  ; Executes ADD before branching
```

Note: When a delayed branch instruction is used, the branching operation takes place after the slot instruction is executed, but the execution of instructions (register update, etc.) takes place in the sequence delayed branch instruction → delayed slot instruction. For example, even if a delayed slot instruction is used to change the register where the branch destination address is stored, the register content previous to the change will be used as the branch destination address.

| | | | |
|---------------|--|-------------------------------|---|
| 6.4.49 | RTS Return from Subroutine Procedure | ReTurn from Subroutine | Branch Instruction Delayed Branch Instruction |
|---------------|--|-------------------------------|---|

| Format | Abstract | Code | Cycle | T Bit |
|---------------|-------------------------|------------------|--------------|--------------|
| RTS | Delayed branch, PR → PC | 0000000000001011 | 2 | — |

Description

Returns from a subroutine procedure. The PC values are restored from the PR, and the program continues from the address specified by the restored PC value. This instruction is used to return to the program from a subroutine program called by a BSR, BSRF, or JSR instruction.

Note

Since this is a delayed branch instruction, the instruction after this RTS is executed before branching. No address errors and interrupts are accepted between this instruction and the next instruction. If the next instruction is a branch instruction, it is acknowledged as an illegal slot instruction.

Operation

```
RTS() /* RTS */
{
    unsigned long temp;

    temp=PC;
    PC=PR+4;
    Delay_Slot(temp+2);
}
```

Example:

```

MOV.L   TABLE, R3      ; R3 = Address of TRGET
JSR     @R3              ; Branches to TRGET
NOP                                           ; Executes NOP before branching
ADD     R0, R1           ; ← Return address for when the subroutine procedure is
                        ; completed (PR data)

```

.....

```
TABLE:  .data.l TRGET;
```

.....

```
TRGET:  MOV     R1, R0      ; ← Procedure entrance
        RTS                                           ; PR data → PC
        MOV     #12, R0   ;

```

Executes MOV before branching

Note: When a delayed branch instruction is used, the branching operation takes place after the slot instruction is executed, but the execution of instructions (register update, etc.) takes place in the sequence delayed branch instruction → delayed slot instruction. For example, even if a delayed slot instruction is used to change the register where the branch destination address is stored, the register content previous to the change will be used as the branch destination address.

6.4.51 SHAL Shift Arithmetic Left Shift Instruction

One-Bit Left
Arithmetic Shift

| Format | Abstract | Code | Cycle | T Bit |
|---------|--------------------------------|------------------|-------|-------|
| SHAL Rn | $T \leftarrow Rn \leftarrow 0$ | 0100nnnn00100000 | 1 | MSB |

Description

Arithmetically shifts the contents of general register Rn to the left by one bit, and stores the result in Rn. The bit that is shifted out of the operand is transferred to the T bit (figure 6.7).

Figure 6.7 Shift Arithmetic Left

Operation

```
SHAL(long n) /* SHAL Rn (Same as SHLL) */
{
    if ((R[n]&0x80000000)==0) T=0;
    else T=1;
    R[n]<<=1;
    PC+=2;
}
```

Example:

```
SHAL R0 ; Before execution: R0 = H'80000001, T = 0
          ; After execution:  R0 = H'00000002, T = 1
```

6.4.52 SHAR Shift Arithmetic Right Shift Instruction

One-Bit Right Arithmetic Shift

| Format | Abstract | Code | Cycle | T Bit |
|---------|--------------|------------------|-------|-------|
| SHAR Rn | MSB → Rn → T | 0100nnnn00100001 | 1 | LSB |

Description

Arithmetically shifts the contents of general register Rn to the right by one bit, and stores the result in Rn. The bit that is shifted out of the operand is transferred to the T bit (figure 6.8).

Figure 6.8 Shift Arithmetic Right

Operation

```
SHAR(long n) /* SHAR Rn */
{
    long temp;

    if ((R[n]&0x00000001)==0) T=0;
    else T=1;
    if ((R[n]&0x80000000)==0) temp=0;
    else temp=1;
    R[n]>>=1;
    if (temp==1) R[n]|=0x80000000;
    else R[n]&=0x7FFFFFFF;
    PC+=2;
}
```

Example:

```
SHAR R0 ; Before execution: R0 = H'80000001, T = 0
        ; After execution:  R0 = H'C0000000, T = 1
```

```

6.4.57 SLEEP SLEEP System Control Instruction

Transition to Power-Down Mode

| Format | Abstract | Code | Cycle | T Bit |
|--------|----------|------------------|-------|-------|
| SLEEP | Sleep | 0000000000011011 | 5 | — |

Description

Sets the CPU into power-down mode. In power-down mode, instruction execution stops, but the CPU internal status is maintained, and the CPU waits for an interrupt request. If an interrupt is requested, the CPU exits the power-down mode and begins exception processing.

Note

The number of cycles given is for the transition to sleep mode.

Operation

```
SLEEP() /* SLEEP */
{
    wait_for_exception;
}
```

Example:

```
SLEEP ; Enters power-down mode
```

6.4.58 STC STORE Control register System Control Instruction

Store from Control Register

| Format | Abstract | Code | Cycle | T Bit |
|-----------------|-------------------------|------------------|-------|-------|
| STC SR,Rn | SR → Rn | 0000nnnn00000010 | 2 | — |
| STC GBR,Rn | GBR → Rn | 0000nnnn00010010 | 1 | — |
| STC VBR,Rn | VBR → Rn | 0000nnnn00100010 | 1 | — |
| STC.L SR,@-Rn | Rn - 4 → Rn, SR → (Rn) | 0100nnnn00000011 | 2 | — |
| STC.L GBR,@-Rn | Rn - 4 → Rn, GBR → (Rn) | 0100nnnn00010011 | 1 | — |
| STC.L VBR,@-Rn | Rn - 4 → Rn, VBR → (Rn) | 0100nnnn00100011 | 1 | — |

Description

Stores control register SR, GBR, or VBR data into a specified destination.

Operation

```

STCSR(long n)    /* STC SR,Rn */
{
    R[n]=SR;
    PC+=2;
}

STCGBR(long n)    /* STC GBR,Rn */
{
    R[n]=GBR;
    PC+=2;
}

STCVBR(long n)    /* STC VBR,Rn */
{
    R[n]=VBR;
    PC+=2;
}

STCMSR(long n)    /* STC.L SR,@-Rn */
{
    R[n]-=4;
    Write_Long(R[n],SR);
}

```

```

    PC+=2;
}
STCMGBR(long n) /* STC.L GBR,@-Rn */
{
    R[n]--=4;
    Write_Long(R[n],GBR);
    PC+=2;
}
STCMVBR(long n) /* STC.L VBR,@-Rn */
{
    R[n]--=4;
    Write_Long(R[n],VBR);
    PC+=2;
}

```

Examples:

```

STC    SR,R0    ; Before execution: R0 = H'FFFFFFFF, SR = H'00000000
          ; After execution:   R0 = H'00000000

STC.L  GBR,@-R15 ; Before execution: R15 = H'10000004
          ; After execution:   R15 = H'10000000, @R15 = GBR

```

6.4.59 STS Store System register System Control Instruction

Store from System Register

| Format | Abstract | Code | Cycle | T Bit |
|-----------------|--------------------------|------------------|-------|-------|
| STS MACH,Rn | MACH → Rn | 0000nnnn00001010 | 1 | — |
| STS MACL,Rn | MACL → Rn | 0000nnnn00011010 | 1 | — |
| STS PR,Rn | PR → Rn | 0000nnnn00101010 | 1 | — |
| STS.L MACH,@-Rn | Rn - 4 → Rn, MACH → (Rn) | 0100nnnn00000010 | 1 | — |
| STS.L MACL,@-Rn | Rn - 4 → Rn, MACL → (Rn) | 0100nnnn00010010 | 1 | — |
| STS.L PR,@-Rn | Rn - 4 → Rn, PR → (Rn) | 0100nnnn00100010 | 1 | — |

Description

Stores data from system register MACH, MACL, or PR into a specified destination.

Operation

```

STSMACH(long n) /* STS MACH,Rn */
{
    R[n]=MACH;
    PC+=2;
}
STSMACL(long n) /* STS MACL,Rn */
{
    R[n]=MACL;
    PC+=2;
}
STSPR(long n) /* STS PR,Rn */
{
    R[n]=PR;
    PC+=2;
}
STSMACH(long n) /* STS.L MACH,@-Rn */
{
    R[n]-=4;

```

```

    Write_Long(R[n],MACH);
    PC+=2;
}
STSMACL(long n) /* STS.L MACL,@-Rn */
{
    R[n]--=4;
    Write_Long(R[n],MACL);
    PC+=2;
}

STSMPR(long n) /* STS.L PR,@-Rn */
{
    R[n]--=4;
    Write_Long(R[n],PR);
    PC+=2;
}

```

Example:

```

STS    MACH,R0    ; Before execution: R0 = H'FFFFFFFF, MACH = H'00000000
                ; After execution:   R0 = H'00000000

STS.L  PR,@-R15  ; Before execution: R15 = H'10000004
                ; After execution:   R15 = H'10000000, @R15 = PR

```

| | | | |

| 6.4.60 | SUB | SUBtract binary | Arithmetic Instruction |
| | Binary Subtraction | | |

| Format | Abstract | Code | Cycle | T Bit |
|-----------|--------------------------|------------------|-------|-------|
| SUB Rm,Rn | $Rn - Rm \rightarrow Rn$ | 0011nnnnmmmm1000 | 1 | — |

Description

Subtracts general register Rm data from Rn data, and stores the result in Rn. To subtract immediate data, use ADD #imm,Rn.

Operation

```
SUB(long m, long n) /* SUB Rm,Rn */
{
    R[n]-=R[m];
    PC+=2;
}
```

Example:

```
SUB R0,R1 ; Before execution: R0 = H'00000001, R1 = H'80000000
           ; After execution:  R1 = H'7FFFFFFF
```

| | | | |
|---------------|-------------|--------------------------------|-------------------------------|
| 6.4.61 | SUBC | SUBtract with Carry | Arithmetic Instruction |
| | | Binary Subtraction with Borrow | |

| Format | Abstract | Code | Cycle | T Bit |
|------------|---|------------------|-------|--------|
| SUBC Rm,Rn | $Rn - Rm - T \rightarrow Rn$, Borrow $\rightarrow T$ | 0011nnnnmmmm1010 | 1 | Borrow |

Description

Subtracts Rm data and the T bit value from general register Rn data, and stores the result in Rn. The T bit changes according to the result. This instruction is used for subtraction of data that has more than 32 bits.

Operation

```

SUBC(long m, long n) /* SUBC Rm,Rn */
{
    unsigned long tmp0,tmp1;

    tmp1=R[n]-R[m];
    tmp0=R[n];
    R[n]=tmp1-T;
    if (tmp0<tmp1) T=1;
    else T=0;
    if (tmp1<R[n]) T=1;
    PC+=2;
}

```

Examples:

```

CLRT          ; R0:R1(64 bits) - R2:R3(64 bits) = R0:R1(64 bits)
SUBC  R3,R1   ; Before execution: T = 0, R1 = H'00000000, R3 = H'00000001
           ; After execution:   T = 1, R1 = H'FFFFFFFF
SUBC  R2,R0   ; Before execution: T = 1, R0 = H'00000000, R2 = H'00000000
           ; After execution:   T = 1, R0 = H'FFFFFFFF

```

| 6.4.62 SUBV | SUBtract with (V flag) underflow check | Arithmetic Instruction |
| Binary Subtraction with Underflow Check | | |

| Format | Abstract | Code | Cycle | T Bit |
|------------|--|------------------|-------|-----------|
| SUBV Rm,Rn | $Rn - Rm \rightarrow Rn$, underflow $\rightarrow T$ | 0011nnnnmmmm1011 | 1 | Underflow |

Description

Subtracts Rm data from general register Rn data, and stores the result in Rn. If an underflow occurs, the T bit is set to 1.

Operation

```

SUBV(long m, long n) /* SUBV Rm,Rn */
{
    long dest,src,ans;

    if ((long)R[n]>=0) dest=0;
    else dest=1;
    if ((long)R[m]>=0) src=0;
    else src=1;
    src+=dest;
    R[n]-=R[m];
    if ((long)R[n]>=0) ans=0;
    else ans=1;
    ans+=dest;
    if (src==1) {
        if (ans==1) T=1;
        else T=0;
    }
    else T=0;
    PC+=2;
}

```

Examples:

```
SUBV R0, R1 ; Before execution: R0 = H'00000002, R1 = H'80000001
           ; After execution:   R1 = H'7FFFFFFF, T = 1

SUBV R2, R3 ; Before execution: R2 = H'FFFFFFFE, R3 = H'7FFFFFFE
           ; After execution:   R3 = H'80000000, T = 1
```

| | | | |
|---------------|--|-----------------------------|----------------------------------|
| 6.4.63 | SWAP Upper-/Lower-Half Swap | SWAP register halves | Data Transfer Instruction |
|---------------|--|-----------------------------|----------------------------------|

| Format | Abstract | Code | Cycle | T Bit |
|---------------|--|------------------|--------------|--------------|
| SWAP.B Rm,Rn | Rm → Swap upper and lower halves of lower 2 bytes → Rn | 0110nnnnmmmm1000 | 1 | — |
| SWAP.W Rm,Rn | Rm → Swap upper and lower word → Rn | 0110nnnnmmmm1001 | 1 | — |

Description

Swaps the upper and lower bytes of the general register Rm data, and stores the result in Rn. If a byte is specified, bits 0 to 7 of Rm are swapped for bits 8 to 15. The upper 16 bits of Rm are transferred to the upper 16 bits of Rn. If a word is specified, bits 0 to 15 of Rm are swapped for bits 16 to 31.

Operation

```
SWAPB(long m, long n) /* SWAP.B Rm, Rn */
```

```
{
    unsigned long temp0, temp1;

    temp0=R[m]&0xffff0000;
    temp1=(R[m]&0x000000ff)<<8;
    R[n]=(R[m]>>8)&0x000000ff;
    R[n]=R[n]|temp1|temp0;
    PC+=2;
}
```

```

|---------------|--|---------------------|----------------------------|

| Format | Abstract | Code | Cycle | T Bit |
|-----------|--|------------------|-------|--------------|
| TAS.B @Rn | When (Rn) is 0, 1 → T, 1 → MSB of (Rn) | 0100nnnn00011011 | 3 | Test results |

Description

Reads byte data from the address specified by general register Rn, and sets the T bit to 1 if the data is 0, or clears the T bit to 0 if the data is not 0. Then, data bit 7 is set to 1, and the data is written to the address specified by Rn. During this operation, the bus is not released.

Operation

```
TAS(long n) /* TAS.B @Rn */
{
    long temp;

    temp=(long)Read_Byte(R[n]); /* Bus Lock enable */
    if (temp==0) T=1;
    else T=0;
    temp|=0x00000080;
    Write_Byte(R[n],temp); /* Bus Lock disable */
    PC+=2;
}
```

Example:

```
_LOOP TAS.B @R7 ;R7 = 1000
    BF _LOOP ; Loops until data in address 1000 is 0
```

|---------------|--|--------------------|-----------------------------------|
| 6.4.65 | TRAPA Trap Exception Handling | TRAP Always | System Control Instruction |
|---------------|--|--------------------|-----------------------------------|

| Format | Abstract | Code | Cycle | T Bit |
|------------|---|--------------------|-------|-------|
| TRAPA #imm | PC/SR → Stack area, (imm × 4 + VBR) → PC | 11000011iiiiiiiiii | 5 | — |

Description

Starts the trap exception processing. The PC and SR values are stored on the stack, and the program branches to an address specified by the vector. The vector is a memory address obtained by zero-extending the 8-bit immediate data and then quadrupling it. The PC is the start address of the next instruction. TRAPA and RTE are both used together for system calls.

Note

For the Renesas Technology Super H RISC engine assembler, declarations should use scaled values (×4) as displacement values.

Operation

```
TRAPA(long i) /* TRAPA #imm */
{
    long imm;

    imm=(0x000000FF & i);
    R[15]--4;
    Write_Long(R[15],SR);
    R[15]--4;
    Write_Long(R[15],PC-2);
    PC=Read_Long(VBR+(imm<<2))+4;
}
```

Example:

Address

VBR+H'80 .data.l 10000000 ;

.....

TRAPA #H'20 ; Branches to an address specified by data in address VBR + H'80

TST #0,R0 ; ← Return address from the trap routine (stacked PC value)

.....

.....

10000000 XOR R0,R0 ; ← Trap routine entrance

10000002 RTE ; Returns to the TST instruction

10000004 NOP ; Executes NOP before RTE

|---------------|--|---------------------|----------------------------|
| 6.4.66 | TST AND Operation T Bit Setting | TeST logical | Logical Instruction |
|---------------|--|---------------------|----------------------------|

| Format | | Abstract | Code | Cycle | T Bit |
|--------|--------------------|---|------------------|-------|--------------|
| TST | Rm,Rn | Rn & Rm, when result is 0, 1 → T | 0010nnnnmmmm1000 | 1 | Test results |
| TST | #imm,R0 | R0 & imm, when result is 0, 1 → T | 11001000iiiiiii | 1 | Test results |
| TST.B | #imm, @(R0,GBR) | (R0 + GBR) & imm, when result is 0, 1 → T | 11001100iiiiiii | 3 | Test results |

Description

Logically ANDs the contents of general registers Rn and Rm, and sets the T bit to 1 if the result is 0 or clears the T bit to 0 if the result is not 0. The Rn data does not change. The contents of general register R0 can also be ANDed with zero-extended 8-bit immediate data, or the contents of 8-bit memory accessed by indirect indexed GBR addressing can be ANDed with 8-bit immediate data. The R0 and memory data do not change.

Operation

```
TST(long m,long n) /* TST Rm,Rn */
{
    if ((R[n]&R[m])==0) T=1;
    else T=0;
    PC+=2;
}
TSTI(long i) /* TEST #imm,R0 */
{
    long temp;

    temp=R[0]&(0x000000FF & (long)i);
    if (temp==0) T=1;
    else T=0;
    PC+=2;
}
TSTM(long i) /* TST.B #imm,@(R0,GBR) */
```

```
{  
    long temp;  
  
    temp=(long)Read_Byte(GBR+R[0]);  
    temp&=(0x000000FF & (long)i);  
    if (temp==0) T=1;  
    else T=0;  
    PC+=2;  
}
```

Examples:

| | | | |
|-------|-----------------|---------------------|------------------|
| TST | R0,R0 | ; Before execution: | R0 = H'00000000 |
| | | ; After execution: | T = 1 |
| TST | #H'80,R0 | ; Before execution: | R0 = H'FFFFFF7F |
| | | ; After execution: | T = 1 |
| TST.B | #H'A5,@(R0,GBR) | ; Before execution: | @(R0,GBR) = H'A5 |
| | | ; After execution: | T = 0 |

| | | | |

| XOR Rm,Rn | $Rn \wedge Rm \rightarrow Rn$ | 0010nnnnmmmm1010 | 1 | — |
| XOR #imm,R0 | $R0 \wedge imm \rightarrow R0$ | 11001010iiiiiii | 1 | — |
| XOR.B #imm, @(R0,GBR) | $(R0 + GBR) \wedge imm \rightarrow (R0 + GBR)$ | 11001110iiiiiii | 3 | — |

Description

Exclusive ORs the contents of general registers Rn and Rm, and stores the result in Rn. The contents of general register R0 can also be exclusive ORed with zero-extended 8-bit immediate data, or 8-bit memory accessed by indirect indexed GBR addressing can be exclusive ORed with 8-bit immediate data.

Operation

```

XOR(long m, long n) /* XOR Rm, Rn */
{
    R[n]^=R[m];
    PC+=2;
}
XORI(long i) /* XOR #imm, R0 */
{
    R[0]^=(0x000000FF & (long)i);
    PC+=2;
}
XORM(long i) /* XOR.B #imm, @(R0, GBR) */
{
    long temp;

    temp=(long)Read_Byte(GBR+R[0]);
    temp^=(0x000000FF & (long)i);
    Write_Byte(GBR+R[0], temp);
    PC+=2;
}

```

Examples:

| | | | |
|-------|-------------------|---------------------|----------------------------------|
| XOR | R0, R1 | ; Before execution: | R0 = H'AAAAAAAA, R1 = H'55555555 |
| | | ; After execution: | R1 = H'FFFFFFF |
| XOR | #H'F0, R0 | ; Before execution: | R0 = H'FFFFFFF |
| | | ; After execution: | R0 = H'FFFFFF0F |
| XOR.B | #H'A5, @(R0, GBR) | ; Before execution: | @(R0, GBR) = H'A5 |
| | | ; After execution: | @(R0, GBR) = H'00 |

|-------------|-------------------------------|------------------|-------|-------|
| XTRCT Rm,Rn | Rm: Center 32 bits of Rn → Rn | 0010nnnnmmmm1101 | 1 | — |

Description

Extracts the middle 32 bits from the 64 bits of coupled general registers Rm and Rn, and stores the 32 bits in Rn (figure 6.13).

Figure 6.13 Extract

Operation

```
XTRCT(long m,long n) /* XTRCT Rm,Rn */
{
    unsigned long temp;

    temp=(R[m]<<16)&0xFFFF0000;
    R[n]=(R[n]>>16)&0x0000FFFF;
    R[n]|=temp;
    PC+=2;
}
```

Example:

```
XTRCT R0,R1 ; Before execution: R0 = H'01234567, R1 = H'89ABCDEF
              ; After execution:  R1 = H'456789AB
```

6.5 Floating-Point Instructions and FPU-Related CPU Instructions

|-------|---|--------------------------------------|-----------------------------------|

| PR | Format | Abstract | Code | Cycle | T Bit |
|----|----------|------------|------------------|-------|-------|
| 0 | FABS FRn | FRn → FRn | 1111nnnn01011101 | 1 | — |
| 1 | FABS DRn | DRn → DRn | 1111nnn001011101 | 1 | — |

Description

This instruction clears the most significant bit of the contents of floating-point register FRn/DRn to 0, and stores the result in FRn/DRn.

The cause and flag fields in FPSCR are not updated.

Operation

```
void FABS (int n){
    FR[n] = FR[n] & 0x7fffffff;
    pc += 2;
}
/* Same operation is performed regardless of precision. */
```

Possible Exceptions:

| 6.5.2 | FADD Floating-Point Addition | Floating-point ADD | Floating-Point Instruction |
|--------------|---|---------------------------|-----------------------------------|

| PR | Format | Abstract | Code | Cycle | T Bit |
|----|--------------|---------------|------------------|-------|-------|
| 0 | FADD FRm,FRn | FRn+FRm → FRn | 1111nnnnmmmm0000 | 1 | — |
| 1 | FADD DRm,DRn | DRn+DRm → DRn | 1111nnn0mmm00000 | 6 | — |

Description

When FPSCR.PR = 0: Arithmetically adds the two single-precision floating-point numbers in FRn and FRm, and stores the result in FRn.

When FPSCR.PR = 1: Arithmetically adds the two double-precision floating-point numbers in DRn and DRm, and stores the result in DRn.

When FPSCR.enable.O/U/I is set, an FPU exception trap is generated regardless of whether or not an exception has occurred. When an exception occurs, correct exception information is reflected in FPSCR.cause and FPSCR.flag, and FRn or DRn is not updated. Appropriate processing should therefore be performed by software.

Operation

```
void FADD (int m,n)
{
    pc += 2;
    clear_cause();
    if((data_type_of(m) == sNaN) ||
        (data_type_of(n) == sNaN)) invalid(n);
    else if((data_type_of(m) == qNaN) ||
        (data_type_of(n) == qNaN)) qnan(n);
    else if((data_type_of(m) == DENORM) ||
        (data_type_of(n) == DENORM)) set_E();
    else switch (data_type_of(m)) {
        case NORM: switch (data_type_of(n)) {
            case NORM:    normal_faddsub(m,n,ADD); break;
            case PZERO:
```

```

        case NZERO: register_copy(m,n); break;

| 0 | FLDI0 FRn | 0x00000000 → FRn | 1111nnnn10001101 | 1 | — |
| 1 | — | — | — | — | — |

Description

When FPSCR.PR = 0, this instruction loads floating-point 0.0 (0x00000000) into FRn.

If FPSCR.PR = 1, the instruction is handled as an illegal instruction.

Operation

```
void FLDI0(int n)
{
    FR[n] = 0x00000000;
    pc += 2;
}
```

Possible Exceptions:

None

| 6.5.10 | FLOAT | Floating-point convert from integer | Floating-Point Instruction |
| | Integer to Floating-Point Conversion | | |

| PR | Format | Abstract | Code | Cycle | T Bit |
|-----------|----------------|--------------------|------------------|--------------|--------------|
| 0 | FLOAT FPUL,FRn | (float)FPUL → FRn | 1111nnnn00101101 | 1 | — |
| 1 | FLOAT FPUL,DRn | (double)FPUL → DRn | 1111nnn000101101 | 2 | — |

Description

When FPSCR.PR = 0: Taking the contents of FPUL as a 32-bit integer, converts this integer to a single-precision floating-point number and stores the result in FRn.

When FPSCR.PR = 1: Taking the contents of FPUL as a 32-bit integer, converts this integer to a double-precision floating-point number and stores the result in DRn.

When FPSCR.enable.I = 1, and FPSCR.PR = 0, an FPU exception trap is generated regardless of whether or not an exception has occurred. When an exception occurs, correct exception information is reflected in FPSCR.cause and FPSCR.flag, and FRn or DRn is not updated. Appropriate processing should therefore be performed by software.

Operation

```
void FLOAT(int n, float *FPUL)
{
union {
    double d;
    int l[2];
} tmp;
pc += 2;
clear_cause();
if(FPSCR.PR==0){
    FR[n] = *FPUL; /* convert from integer to float */
    tmp.d = *FPUL;
    if(tmp.l[1] & 0x1fffffff) inexact();
} else {
    DR[n>>1] = *FPUL; /* convert from integer to double */
}
}
```

Possible Exceptions:

Inexact: Not generated when FPSCR.PR = 1.

| -INF | | | | -INF | +INF | | |
| qNaN | | | | | | | |
| sNaN | | | | | | | Invalid |

Note: The value of a denormalized number is treated as 0.

Possible Exceptions:

- Invalid operation
- Overflow
- Underflow
- Inexact

| | | | |
|---------------|---|------------------------------------|-----------------------------------|
| 6.5.14 | FNEG Floating-Point Sign Inversion | Floating-point NEGate value | Floating-Point Instruction |
|---------------|---|------------------------------------|-----------------------------------|

| PR | Format | Abstract | Code | Cycle | T Bit |
|----|----------|------------|------------------|-------|-------|
| 0 | FNEG FRn | -FRn → FRn | 1111nnnn01001101 | 1 | — |
| 1 | FNEG DRn | -DRn → DRn | 1111nnn001001101 | 1 | — |

Description

This instruction inverts the most significant bit (sign bit) of the contents of floating-point register FRn/DRn, and stores the result in FRn/DRn.

The cause and flag fields in FPSCR are not updated.

Operation

```
void FNEG (int n){
    FR[n] = -FR[n];
    pc += 2;
}
```

```
/* Same operation is performed regardless of precision. */
```

Possible Exceptions:

| | | | |
|---------------|--------------------------------------|----------------------|-----------------------------------|
| 6.5.15 | F SCHG SZ Bit Inversion | Sz-bit CHanGe | Floating-Point Instruction |
|---------------|--------------------------------------|----------------------|-----------------------------------|

| PR | Format | Abstract | Code | Cycle | T Bit |
|----|--------|--------------------|------------------|-------|-------|
| 0 | FCHG | FPSCR.SZ=~FPSCR.SZ | 1111001111111101 | 1 | — |
| 1 | — | — | — | — | — |

Description

When FPSCR.PR = 0, this instruction inverts the SZ bit in floating-point register FPSCR. Changing the SZ bit in FPSCR switches FMOV instruction data transfer between one single-precision data unit and a data pair. When FPSCR.SZ = 0, the FMOV instruction transfers one single-precision data unit. When FPSCR.SZ = 1, the FMOV instruction transfers two single-precision data units as a pair.

If FPSCR.PR = 1, the instruction is handled as an illegal instruction.

Operation

```
void FCHG() /* FCHG */
{
    if(FPSCR_PR == 0){
        FPSCR ^= 0x00100000; /* bit 20 */
        PC += 2;
    }
    else undefined_operation();
}
```

Possible Exceptions:

None

|---------------|---|-----------------------------------|-----------------------------------|
| 6.5.16 | FSQRT Floating-Point Square Root | Floating-point Square Root | Floating-Point Instruction |
|---------------|---|-----------------------------------|-----------------------------------|

| PR | Format | Abstract | Code | Cycle | T Bit |
|----|-----------|------------------------------|------------------|-------|-------|
| 0 | FSQRT FRn | $\sqrt{FRn} \rightarrow FRn$ | 1111nnnn01101101 | 9 | — |
| 1 | FSQRT DRn | $\sqrt{DRn} \rightarrow DRn$ | 1111nnnn01101101 | 22 | — |

Description

When FPSCR.PR = 0: Finds the arithmetical square root of the single-precision floating-point number in FRn, and stores the result in FRn.

When FPSCR.PR = 1: Finds the arithmetical square root of the double-precision floating-point number in DRn, and stores the result in DRn.

When FPSCR.enable.I is set, an FPU exception trap is generated regardless of whether or not an exception has occurred. When an exception occurs, correct exception information is reflected in FPSCR.cause and FPSCR.flag, and FRn or DRn is not updated. Appropriate processing should therefore be performed by software.

Operation

```
void FSQRT(int n){
    pc += 2;
    clear_cause();
    switch(data_type_of(n)){
        case NORM :   if(sign_of(n) == 0) normal_fsqrt(n);
                       else          invalid(n); break;
        case PZERO :
        case NZERO :
        case PINF  :   break;
        case NINF  :   invalid(n); break;
        case qNaN  :   qnan(n);    break;
        case sNaN  :   invalid(n); break;
    }
}
```

```

void normal_fsqrt(int n)
{
union {
    float f;
    int l;
}    dstf,tmpf;
union {
    double d;
    int l[2];
}    dstd,tmpd;

STS.L  FPUL, @-R7  
; Before executing the STS.L instruction:  
; R7 = 0C700148  
; After executing the STS.L instruction:  
; R7 = 0C700144, and the content of FPUL is saved at memory  
; location 0C700144.
```

Example 2:

```
MOV.L  #H'0C700154, R8  
STS.L  FPSCR, @-R8  
; After executing the STS.L instruction:  
; The content of FPSCR is saved at memory location 0C700150.
```

Section 7 Register Banks

7.1 Overview

The SH-2A/SH2A-FPU has on-chip register banks to provide high-speed register save and retrieve performance during interrupt processing. The configuration of the register banks is shown in figure 7.1.

Figure 7.1 Overview of Register Bank Configuration

7.2 Register Banks and Bank Control Registers

7.2.1 Banked Data

The contents of general registers R0 to R14, the global register (GBR), the multiply and accumulate registers (MACH, MACL), the procedure register (PR), and the interrupt vector table address offsets (VTO) are banked.

7.2.2 Register Banks

The number of register banks is N, numbered from bank 0 to bank N – 1 (maximum 512 banks). Register banks are stacked in first in last out (FILO) sequence. Saves take place in order, beginning from bank 0, and retrieves take place in the reverse order, beginning from the last bank saved to. The number of banks, N, differs depending on the product. For details, refer to the Register Banks section of the hardware manual for the product in question.

7.2.3 Bank Control Registers

(1) Bank Control Register (IBCR) (16 bit, Initial value: H'0000)

This register is used to allow or prohibit the use of specific register banks, based on the interrupt priority level or the interrupt source. The register specifications and initial values differ depending on the product. For details, refer to the Interrupt Controller section of the hardware manual for the product in question.

| | | | | | | | | | | | | | | | | |
|-----|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|---|
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | E15 | E14 | E13 | E12 | E11 | E10 | E9 | E8 | E7 | E6 | E5 | E4 | E3 | E2 | E1 | — |

Bits 15 to 1: E15 to E1

The setting of these bits is used to allow or prohibit use of register banks based on interrupt priority level (15 to 1).

Bits 15 to 1

| E15 to E1 | Description |
|-----------|----------------------------------|
| 0 | Register bank use is prohibited. |
| 1 | Register bank use is allowed. |

Bit 0: Reserved Bit

This bit is always read as 0 and only a value of 0 should be written to it.

(2) Bank Number Register (IBNR) (16 bit, Initial value: H'0000)

| | | | | | | | | | | | | | | | | |
|-----|-----|-----|------|----|----|----|---|---|---|---|---|---|-----|-----|-----|-----|
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | BE1 | BE0 | BOVE | — | — | — | — | — | — | — | — | — | BN3 | BN2 | BN1 | BN0 |

The setting of the bank number register (IBNR) is used to allow or prohibit use of register banks and to allow or prohibit register bank overflow exceptions. In addition, bits BN3 to BN0 indicate the number of the next bank to be saved to. They are initialized to H'0000 by a power-on reset.

Bits 15 and 14: BE1, BE0

These bits specify whether register bank use is prohibited or allowed.

Bits 15, 14

| BE1, BE0 | Description |
|-----------------|--|
| 00 | Use of the bank is prohibited for all interrupts. The setting of IBCR is ignored. (Initial value) |
| 01 | Use of the bank is prohibited for all interrupts except NMI and UBC. The setting of IBCR is ignored. |
| 10 | Reserved. (Do not attempt to set this bit.) |
| 11 | Use of the bank is as specified by IBCR. |

Bit 13: BOVE

This bit specify whether register bank overflow exceptions are prohibited or allowed.

Bit 13

| BOVE | Description |
|-------------|---|
| 0 | Generation of register bank overflow exceptions is prohibited. (Initial value) |
| 1 | Generation of register bank overflow exceptions is allowed. |

Bits 12 to 4: Reserved Bits

These bits are always read as 0 and only a value of 0 should be written to them.

Bits 3 to 0: BN3 to BN0

These bits indicate the number of the next bank to be saved to. When an interrupt that uses a register bank is received, it is saved to the bank specified by BN3 to BN0 and BN is incremented by 1. Execution of a register bank retrieve instruction causes BN to be decremented by 1, after which the data is retrieved from the register bank. These bits are read-only and cannot be modified.

7.3 Bank Save and Retrieve Operations

7.3.1 Save to Bank

Figure 7.2 illustrates the register bank save operations. The following operations are performed when an interrupt for which register bank use is allowed by IBCR is received by the CPU.

- (a) Assume that the IBNR bank number value, BN, is i before the interrupt is generated.
- (b) The contents of registers R0 to R14, GBR, MACH, MACL, PR, and the interrupt vector table address offset (VTO) are saved to the bank indicated by the BN, bank i .
- (c) The BN value is incremented by 1.

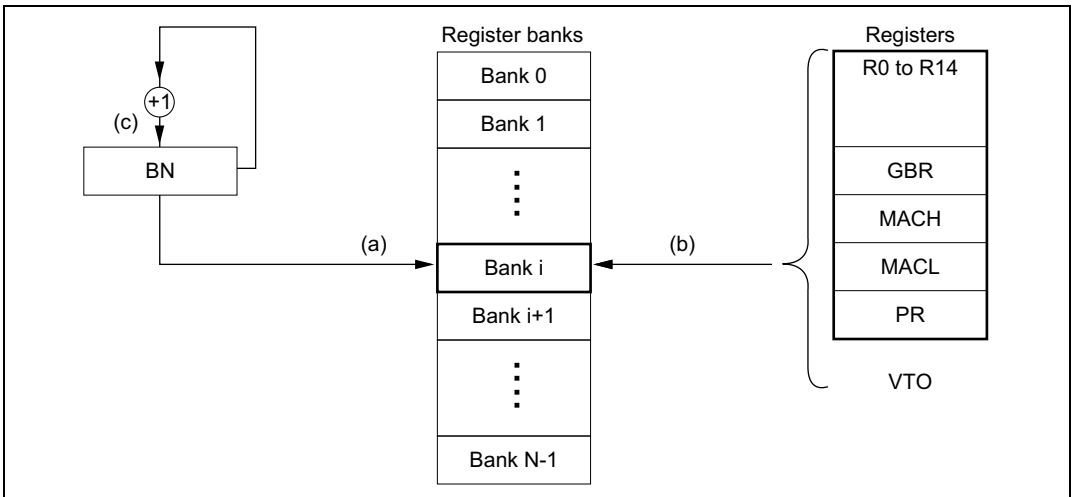

Figure 7.2 Bank Save Operations

Figure 7.3 illustrates the register bank save timing. Saving to the bank takes place between the start of interrupt exception processing and the start of the fetch of the first instruction in the exception service routine.

Figure 7.3 Bank Save Timing

7.3.2 Retrieve from Bank

The retrieve from bank instruction, RESBANK, is used to retrieve data stored in a bank. After retrieving the data from the bank with the RESBANK instruction at the end of the interrupt service routine, use the RTE instruction to return from exception processing.

7.3.3 Save and Retrieve Operations after Saving to All Banks

If, after data has been saved to all of the register banks, an interrupt for which register bank use is allowed is received by the CPU, data is saved automatically to the stack instead of a register bank. This is possible by masking the register bank overflow exception using the interrupt controller. If a register bank overflow exception were generated it would not be possible to save to the stack. For details, refer to the Interrupt Controller section of the hardware manual for the product in question. The automatic save to and retrieve from stack operations are described below.

(1) Save to Stack

- When interrupt exception processing occurs, the status register (SR) and program counter (PC) are saved on the stack.
- The contents of the banked registers (R0 to R14, GBR, MACH, MACL, and PR) are saved to the stack. The order in which the contents of these registers are saved is MACL, MACH, GBR, PR, R14, R13, ... R1, R0.
- The register bank overflow bit in SR is set to 1.
- The bank number (BN) bits in the bank number register (IBNR) remain set to the maximum value, N.

(2) Retrieve from Stack

If the retrieve from bank instruction, RESBANK, is executed when the register bank overflow bit in SR is set to 1, the following operations occur.

- (a) The contents of the banked registers (R0 to R14, GBR, MACH, MACL, and PR) are retrieved from the stack. The order in which the contents of these registers are retrieved is R0, R1, ... R13, R14, PR, GBR, MACH, MACL.
- (b) The bank number (BN) bits in the bank number register (IBNR) remain set to the maximum value, N.

7.4 Register Bank Data Send Instructions

The LDBANK and STBANK instructions can be used to send user-defined register bank data to and from general register R0 for debugging purposes.

7.4.1 Description of Instructions

(1) LDBANK (Load Data from Register Bank to R0)

Format: LDBANK @Rm,R0

Operation: Sends 4 bytes of data from the register bank address indicated by Rm to R0.

(2) STBANK (Store Data from R0 to Register Bank)

Format: STBANK R0,@Rn

Operation: Sends the contents of R0 to the register bank address indicated by Rn.

7.4.2 Register Bank Addressing

Figure 7.4 illustrates the correlation between register bank send command address values (Rm in the case of LDBANK and Rn in the case of STBANK) and register bank entries. The bank number is specified by address bits 15 to 7 (BN), and the entry within the bank (R0 to R14, GBR, MACH, MACL, PR, VTO) is specified by address bits 6 to 2 (EN). Address bits 31 to 16 and 1 to 0 should all be cleared to 0. If the value of these bits is not all 0 operation cannot be guaranteed in cases where a nonexistent bank is specified by address bits 15 to 7 or a nonexistent entry is specified by address bits 6 to 2.

Figure 7.4 Register Bank Addressing

7.5 Register Bank Exceptions

There are two types of register bank exception (register bank error): register bank overflow and register bank underflow.

7.5.1 Register Bank Error Sources

(1) Register Bank Overflow

This exception occurs if, after data has been saved to all of the register banks, an interrupt for which register bank use is allowed is received by the CPU, and the register bank overflow exception is not masked by the interrupt controller. In this case the bank number (BN) bits in the bank number register (IBNR) remain set to the maximum value, N, and no data is saved to the register bank.

(2) Register Bank Underflow

This exception occurs if the RESBANK instruction is executed when no data has been saved to the register banks. In this case the values of R0 to R14, GBR, MACH, MACL, and PR do not change. In addition, the bank number (BN) bits in the bank number register (IBNR) remain set to 0.

7.5.2 Register Bank Error Exception Processing

If a register bank error is generated, register bank error exception processing begins. When this happens the CPU performs the following operations.

1. The contents of the status register (SR) are saved to the stack.
2. The value of the program counter (PC) is saved to the stack. The PC value that is saved when a register bank overflow occurs is the starting address of the next instruction after the last executed instruction. The PC value that is saved when a register bank underflow occurs is the starting address of the relevant RESBANK instruction.
To prevent multiple interrupts from occurring when a bank overflow occurs, the level of the interrupt that caused the overflow is written to the interrupt mask bits (I3 to I0) of the status register (SR).
3. The exception service routine start address is extracted from the exception processing vector table corresponding to the register bank error, and the program is run beginning from that address.

7.6 SR Register Bank Overflow Bit (BO Bit)

The BO bit is modified when the contents of the SR register are retrieved by the RTE instruction. The BO bit is not modified when a RESBANK instruction is executed. The BO bit is set to 1 if exception generation by the interrupt controller is not enabled in cases where a bank overflow occurs during an interrupt. If exception generation by the interrupt controller is enabled for cases when a bank overflow occurs during an interrupt, the BO bit is not modified. The BO bit is modified by the LDC Rm.SR and LDC.L @Rmt.SR instructions.

Section 8 Pipeline Operation

This section describes the pipeline operation of the various instructions. This is information for calculating the number of CPU instruction execution states (number of system clock cycles).

The SH-2A/SH2A-FPU is a 2-ILP (2-Instruction-Level-Parallelism) super-scalar pipelining microprocessor. Instruction execution is pipelined, and two instructions can be executed in parallel. A Harvard architecture is used, and there is no contention between memory accesses and instruction fetches. As an instruction fetch unit is provided, the CPU core does not stop during an instruction fetch.

8.1 Basic Pipeline Configuration

The SH-2A/SH2A-FPU has the following pipelines (see figure 8.1).

- Integer pipelines 1 and 2: Process integer operations.
- Memory access pipeline: Processes memory accesses and the loading of data to the FPU.
- Multiplier pipeline: Processes multiply instructions and the storing of data from the FPU.
- Branch pipeline: Processes branch instructions.
- Shift pipeline: Processes shift instructions.
- FPU load/store pipeline: Processes FPU load/store instructions.
- FPU arithmetic operation pipeline: Processes FPU arithmetic operations.
- FPU division/square root extraction pipeline: Processes FPU division and square root extraction.

All instructions are first processed by an integer pipeline, and are also passed to another pipeline if necessary. These pipelines can all operate independently of each other. Therefore, if there is no contention, two instructions can always continue to be issued.

Instructions that perform memory access and instructions that load data from the CPU to the FPU use the memory access pipeline.

Multiply instructions and multiplication result register access instructions use the multiplier pipeline. In addition, instructions that store data from the FPU use the WB stage of the multiplier pipeline.

Branch instructions use the branch pipeline. Shift instructions use the shift pipeline.

Instructions that perform FPU internal register moves or data exchange from the FPU to memory or the CPU use the FPU load/store pipeline.

Instructions that perform FPU arithmetic operations use the FPU arithmetic operation pipeline.

Of the FPU arithmetic operations, FDIV and FSQRT use the FPU arithmetic operation pipeline and FPU division/square root extraction pipeline.

See section 8.9, Pipeline Operations for Each Instruction, for details.

The CPU pipeline stages are described in detail below.

- **IF: Instruction fetch**
An instruction is fetched from memory in which the program is stored.
- **ID: Instruction decoding**
The fetched instruction is decoded.
- **EX: Instruction execution**
A data operation or address calculation is performed in accordance with the result of decoding.
- **MA: Memory access**
A memory data access is performed.
Generated by an instruction accompanying a memory access or an instruction that performs data exchange between the CPU and FPU.
- **mm: Multiplier access**
A multiplier access is performed.
Generated by an instruction accompanying a memory access or an instruction that loads data from the CPU to the FPU.
- **WB: Write-back**
The result (data) accessed by a memory access or multiplier access is returned to the register.

The FPU pipeline stages are described in detail below. CPU and FPU pipelines share the first-stage instruction fetch (IF).

- **DF: FPU decoding**
The fetched instruction is decoded.
- **E1: FPU execution stage 1**
A floating-point operation is initialized.
- **E2: FPU execution stage 2**
The floating-point operation is executed.

- SF: FPU store
The floating-point operation is completed, and the result is written to an FPU register.
- ED: FPU division and square root calculation
Used only for FDIV and FSQRT.
- EX: FPU load/store stage 1
Floating-point load/store instruction data preparation is performed.
- NA: FPU load/store stage 2
Floating-point load/store instruction data exchange is performed.

The length of all stages after ID and DF is the same. Only IF may be extended due to a wait for data, but as the instruction fetch unit and pipelines operate independently, pipelining can be continued in this case, also, for instructions that have already been fetched.

As shown in figure 8.2, instruction stages continue to flow together with instruction execution, forming a pipeline. The basic pipeline flow is shown in figure 8.1. The interval during which one stage is executed is called a slot, and is indicated by “ \longleftrightarrow ”. Each instruction has at least a 3-stage structure.

The three stages IF, ID, and EX (integer pipeline) are present for each instruction. Thereafter, instruction processing is performed with the necessary pipelines operating simultaneously.

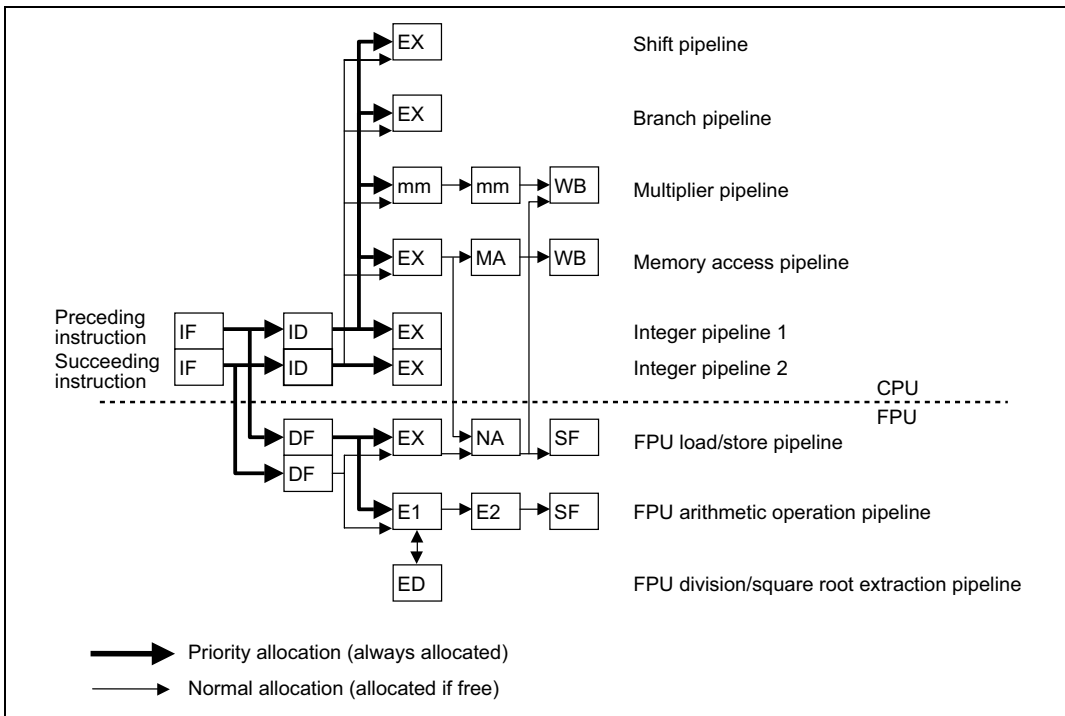

Figure 8.1 SH-2A/SH2A-FPU Pipelines

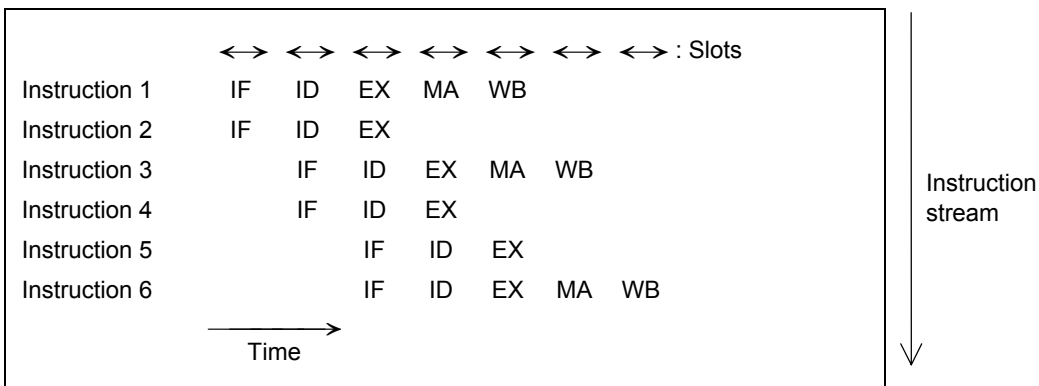

Figure 8.2 Basic Pipeline Configuration

8.2 Slots and Pipeline Flow

The interval during which one stage is executed is called a slot. The following rules apply to a slot.

- (1) Each stage of an instruction (IF, ID, EX, MA, WB, mm, E1, E2, DF, ED, SF, NA) is always executed in one slot. Two or more stages are never executed in one slot (see figure 8.3). The ED stage operates without regard to a slot.

Figure 8.3 Impossible Pipeline Flow (1)

- (2) The maximum number of different stages of different instructions set in one slot is two in the case of integer pipelines, and one in the case of other pipelines. Simultaneous pipeline execution never exceeds this number (see figure 8.4).

Figure 8.4 Impossible Pipeline Flow (2)

- (3) The number of states (number of system clock cycles) S required for execution of one slot is calculated using the following conditions.

- (a) $S =$ (maximum number of states among stages of each instruction contained in one slot)

That is to say, instructions that have other short stages are stalled by the longest stage.

- (b) The number of execution states of each stage is as follows:

- IF: Number of memory access clocks for instruction fetch
(As a fetch buffer is provided and instruction fetches are performed beforehand, pipeline stalling only occurs when a fetched instruction must be decoded immediately.)
- ID: Always 1 state
- EX: Always 1 state

- MA: Number of memory access clocks for data access
- WB: Always 1 state
- mm: Always 1 state
- DF: Always 1 state
- E1: Always 1 state
- E2: Always 1 state
- SF: Always 1 state
- ED: Always 1 state, but operates without regard to slots.
- NA: Always 1 state

For example, figure 8.5 shows the pipeline flow when IF (memory access for instruction fetch) of instructions 1 and 2 takes 2 cycles, MA (memory access for data access) of instruction 1 takes 3 cycles, and other stages take 1 cycle. “—” indicates stalling. For the sake of simplicity, this figure does not take super-scalar operation into consideration.

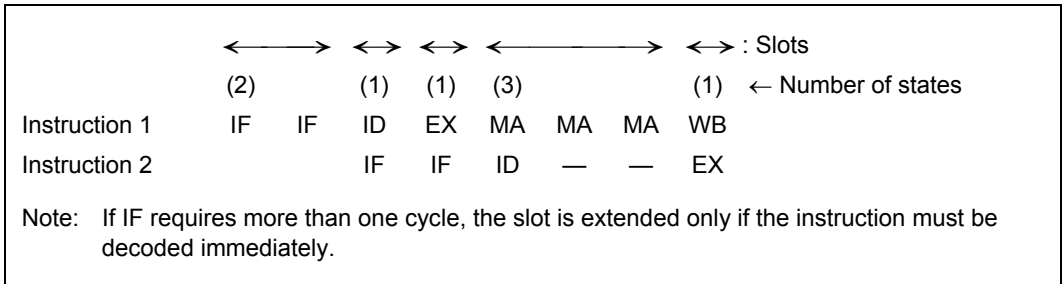

Figure 8.5 Slots Requiring a Number of Cycles

8.3 Instruction Execution and Parallel Execution Capability

The SH-2A/SH2A-FPU is a 2-ILP (2-Instruction-Level-Parallelism) super-scalar pipelining microprocessor. When two instructions are in the ID stage, two instructions can be executed simultaneously (see figure 8.6).

| | | | | | | |
|--------------|----|----|----|----|----|----|
| ADD R2,R3 | IF | ID | EX | | | |
| MOV.L @R0,R1 | IF | ID | EX | MA | WB | |
| ADD R4,R3 | | IF | ID | EX | | |
| FADD FR1,FR2 | | IF | DF | E1 | E2 | SF |

Figure 8.6 Example of Parallel Execution

However, parallel execution is not possible in the following cases:

- When resource contention occurs (described in 8.3.1)
- When waiting for the result of a previously issued instruction (described in 8.3.2)
- When register contention or flag contention occurs (described in 8.3.3)
- When a multi-cycle instruction is executed as a preceding instruction (described in 8.3.4)
- When a 32-bit instruction is executed as a preceding instruction (described in 8.3.5)
- In the case of an instruction that uses FPSCR, an FPU instruction, or an FPU-related CPU instruction (described in 8.3.6)
- Delayed unconditional branch instruction at which a branch occurs, and delay slot (described in 8.3.7)

When IF stages are completed for two instructions without the occurrence of such contention, the SH-2A/SH2A-FPU can perform parallel execution of the two instructions.

The above cases are described in the following subsections. Terms used in the descriptions are as follows:

- Preceding instruction: Earlier instruction in the same slot
- Succeeding instruction: Later instruction in the same slot
- Previously issued instruction: Generic term for an instruction that has already been issued

| | | | | | | |
|-------------------------------|----|----|----|----|----|----|
| Previously issued instruction | IF | ID | EX | | | |
| Previously issued instruction | IF | ID | EX | MA | WB | |
| Preceding instruction | | IF | ID | EX | | |
| Succeeding instruction | | IF | ID | E1 | E2 | SF |

Note: Box indicates reference slot.

Figure 8.7 Definitions of Preceding, Succeeding, and Previously Issued Instructions

8.3.1 Details of Resource Contention

As there is only one each of pipelines other than integer pipelines, if a preceding instruction and succeeding instruction attempt to use such a pipeline simultaneously, contention occurs and the succeeding instruction has to wait to be executed. Cases in which contention occurs are as follows.

- (1) When the preceding instruction and succeeding instruction are both instructions accompanying a memory access (figure 8.8)

Alternatively, in the case of a combination of a CPU → FPU data transfer instruction and memory write instruction (figure 8.8), or a combination with another FPU → CPU data transfer instruction.

In these cases, memory access pipeline contention occurs.

| | | | | | |
|---------------|----|----|----|----|----|
| MOV.L @R1+,R2 | IF | ID | EX | MA | |
| MOV.L @R1+,R3 | IF | — | ID | EX | MA |

Note: There is a maximum of one memory access (MA) per slot.

Figure 8.8 Example of Memory Access Contention

| | | | | | | | |
|--------------|----|----|----|----|----|--|----------------|
| LDS R0,FPUL | IF | ID | EX | | | | : CPU pipeline |
| | IF | DF | EX | NA | SF | | : FPU pipeline |
| MOV.L R1,@R3 | IF | — | ID | EX | MA | | : CPU pipeline |

Note: Contention between LDS instruction and memory write instruction

Figure 8.9 Example of Contention between LDS Instruction and Memory Write Instruction

Instructions that transfer data from the FPU to the CPU do not conflict with memory access instructions (figure 8.10). In addition, instructions that transfer data from the CPU to the FPU do not conflict with memory access instructions (figure 8.11).

| | | | | | | | | | | | |
|---|---------|----|----|----|----|----|----|--|--|--|----------------|
| STS | FPUL,R0 | IF | ID | EX | WB | | | | | | : CPU pipeline |
| | | IF | DF | EX | NA | SF | | | | | : FPU pipeline |
| MOV.L | R1,@R3 | IF | ID | EX | MA | WB | WB | | | | : CPU pipeline |

| | | IF | DF | EX | NA | SF | | | | | : FPU pipeline |
| MOV.L | @R1+,R3 | IF | ID | EX | MA | WB | | | | | : CPU pipeline |
| Note: No contention between LDS instruction and memory read instruction | | | | | | | | | | | |

Figure 8.11 Example of LDS Instruction and Memory Read Instruction

(2) When the preceding instruction and succeeding instruction are both instructions that use the multiplier (figure 8.12).

With the multiplier, contention also occurs when a previously issued instruction is locked (figure 8.13).

In addition, instructions that read MACH or MACL, MULR instructions, and instructions that transfer the value of FPUL or FPSCR to the CPU cause contention because they share the read bus (figure 8.14).

| | | | | | | | | | | | |
|--------|-------|----|----|----|----|----|----|----|--|--|--|
| MULS.W | R2,R1 | IF | ID | mm | mm | | | | | | |
| MULR | R0,R3 | IF | — | ID | mm | mm | mm | WB | | | |

| | | | | | | | |
|------|-------|----|----|----|----|--|--|
| SHAD | R0,R1 | IF | ID | EX | | | |
| SHAD | R2,R3 | IF | — | ID | EX | | |

Figure 8.15 Example of Shift Instruction Contention

- (4) When the preceding instruction and succeeding instruction are both FPU arithmetic operation instructions (figure 8.16)

With regard to FPU arithmetic operation instructions, complex resource contention occurs with double-precision instructions or with FDIV or FSQRT instructions. See section 8.6, Contention Due to FPU, for details.

| | | | | | | | |
|------|---------|----|----|----|----|----|----|

| | | | | | | | |
|------|---------|----|----|----|----|----|----|
| FNEG | FR0 | IF | DF | EX | NA | SF | |
| FMOV | FR1,FR3 | IF | — | DF | EX | NA | SF |

Figure 8.17 Example of FPU Load/Store Instruction Contention

8.3.2 Details of Contention Due to Wait for Result of Previously Issued Instruction

When the result of a previously issued instruction is used as a source, execution is performed after a wait equivalent to the latency of that instruction. Cases where this applies include the following:

- When waiting for the result of a memory access (see section 8.5, Effect of Memory Load Instruction on Pipeline, for details)
- When waiting for the result of an FPU operation (see section 8.6, Contention Due to FPU, for details)
- When waiting for the result of multiplication (see section 8.7, Contention Due to Multiplier, for details)

If the preceding instruction causes contention in these cases, the succeeding instruction must wait to be executed.

If the succeeding instruction causes contention, the preceding instruction is executed if there is no other contention.

8.3.3 Details of Register Contention and Flag Contention

In the following cases, register contention or flag contention occurs in the same slot.

- (1) When the succeeding instruction uses the destination register or flag of the preceding instruction as a source register or flag (excluding a case where the preceding instruction is a zero-latency instruction) (figures 8.18 and 8.19)

| | | | | | |
|--------------|----|----|----|----|--|

| MOV R3,R4 | IF | ID | EX | | |
| ADD R4,R5 | IF | ID | EX | | |

Figure 8.19 Example of No Contention between Zero-Latency Instruction and Succeeding Instruction

- (2) When the succeeding instruction writes to the destination register or flag of the preceding instruction. (However, contention only occurs if an instruction other than a multiply instruction, divide instruction, LDBANK instruction, RESBANK instruction, MOVML instruction, or MOVML instruction writes to registers and flags other than the FPU register and CS bit. No contention is detected with a multiply instruction, divide instruction, LDBANK instruction, or RESBANK instruction. In addition, contention is only detected for Rn with the MOVML instruction and for R0 with the MOVML instruction. No contention occurs if either of these instructions write to other registers.) (Figures 8.20 to 8.25)

Figure 8.28 Multicycle 32-Bit Instruction Execution Example

8.3.5 Details of Contention Due to 32-Bit Instruction

The following rules apply to execution of 32-bit instructions.

- (1) Parallel execution is not possible when the preceding instruction is a 32-bit instruction (figure 8.29).
- (2) When the succeeding instruction is a 32-bit instruction, the preceding instruction can be executed but the succeeding instruction cannot (figure 8.29).
- (3) The last slot of a multi-cycle instruction and a 32-bit instruction can be executed in parallel (figure 8.26).
- (4) Only in cases where the preceding instruction in the last slot is a multicycle 32-bit instruction such as BAND.B, BANDNOT.B, BLD.B, BLDNOT.B, BOR.B, BORNOT.B, or BXOR, and the instruction on the next line is BAND.B, BANDNOT.B, BLD.B, BLDNOT.B, BOR.B, BORNOT.B, or BXOR, does parallel execution take place. Parallel execution does not occur in combinations with any other instructions (figures 8.27 and 8.28).
- (5) A 32-bit instruction cannot be executed unless IF has been completed for the upper 16 bits and the lower 16 bits (figure 8.30).

Relevant examples are shown in figures 8.26 and 8.27.

| (lower 16 bits) | | | | IF | ID | |

Figure 8.30 Example of 32-Bit Instruction Internal Stalling

8.3.6 Details of Contention Due to Instruction that Uses FPSCR

If an instruction uses FPSCR, parallel execution is not possible with any other instruction if this instruction precedes it. If this instruction follows, parallel execution is not possible with FPU instructions or FPU-related CPU instructions (figure 8.31).

| | | | | | | |
|--------------|----|----|----|----|----|----|
| ADD R3,R4 | IF | ID | EX | | | |
| STS FPSCR,R1 | IF | ID | EX | WB | SF | |
| FADD FR1,FR3 | | IF | DF | E1 | E2 | SF |

Figure 8.31 Example of Contention in Case of Instruction that Uses FPSCR

8.3.7 Details of Contention Due to Branch Instruction

The following rules apply to contention due to a branch instruction.

- (1) Parallel execution is possible when the branch instruction does not branch.
- (2) When a branch instruction is supplied as a succeeding instruction, parallel execution with the preceding instruction is possible regardless of the branching situation.
- (3) When a branch instruction is supplied as a preceding instruction, parallel execution with the succeeding instruction is not possible if a branch occurs. Parallel execution is not possible even if IF has already been completed for the delay slot (figure 8.32).
- (4) For the delay slot, ID is performed in the next slot in which there is a branch instruction EX stage.
- (5) Execution of a delayed branch instruction is delayed if a fetch has not been performed for the delay slot.

A relevant example is shown in figure 8.28.

| | | | | | |
|--------------------------------|----|----|----|----|----|
| ADD R3,R4 | IF | ID | EX | | |
| JMP @R2 | IF | ID | EX | | |
| Delay slot | | IF | — | ID | EX |
| Branch destination instruction | | | | IF | ID |

Figure 8.32 Example of Contention between Branch Instructions

8.4 Number of Instruction Execution States

The number of execution states of an instruction is counted in the EX stage execution interval. The number of states from the start of instruction 1 EX stage execution until the start of the EX stage of following instruction 2 constitutes the execution time of instruction 1.

For example, in the case of the pipeline flow shown in figure 8.33, the EX stage interval of instruction 1 and instruction 2 consists of 4 stages, and therefore the instruction 1 execution time is 4 states. Also, the EX stage interval of instruction 2 and instruction 3 consists of 1 states, and therefore the instruction 2 execution time is 1 state.

If the program ends at instruction 3, take instruction 4 as the next instruction after instruction 3 in virtual terms, and calculate the execution time of instruction 3 from the EX stages of instruction 3 and instruction 4 in MOV Rm,Rn. (In the example in figure 8.33, the execution time of instruction 3 is 1 state.)

The execution time from instruction 1 through instruction 3 in figure 8.33 is a total of $4 + 1 + 1 = 6$ states.

For the sake of simplicity, this figure does not take super-scalar operation into consideration.

Figure 8.33 Example of How to Count Number of Instruction Execution States

8.5 Effect of Memory Load Instruction on Pipeline

With an instruction that performs a load from memory, return of data to the destination register is performed in the WB stage at the end of the pipeline. Looking at such a load instruction (designated “load instruction 1” here) and the instruction immediately following it (designated “instruction 2”), the EX stage of instruction 2 comes before the WB stage of load instruction 1.

If, in this case, the destination register of load instruction 1 is used by instruction 2, since the contents of that register have not yet been prepared, execution of the ID stage is delayed for a period equivalent to the latency of instruction 1. The same also applies if the destination register of load instruction 1 is the same as the destination, rather than the source, of instruction 2.

Similarly, execution of the ID stage is stalled for an additional slot if the destination of load instruction 1 is the status register (SR) and a flag in SR is fetched and used by instruction 2 (such as ADDC, for example).

When this kind of register contention occurs, the slot in which the destination register can be used is the cycle after completion of the MA stage of instruction 1. This is illustrated in figure 8.34.

Therefore, if program is written in which an instruction that uses the result of a load instruction is placed immediately after that load instruction, execution speed will decrease. Generally, the latency of a load instruction is 2, and therefore speed will not decrease if an instruction that uses the result of a load is placed 3 or 4 instructions after the load instruction. If a memory access instruction is executed as a preceding instruction, the applicable number of instructions is 4 or more, and if executed as a succeeding instruction, 3 or more.

| | | | | | | |

Figure 8.34 Effect of Memory Load Instruction on Pipeline

8.6 Contention Due to FPU

When a register (FR0 to FR15, or FPUL) that stores the result of a floating-point arithmetic operation instruction, FMOV instruction, or floating-point load instruction is read (used as a source register) by a following floating-point arithmetic operation instruction or FMOV FRm,FRn instruction, the next instruction is issued after completion of the operation. As a result, that instruction is kept waiting for a period equivalent to the latency cycle of the preceding operation instruction (figure 8.35). A zero-latency instruction can be executed in parallel with the succeeding instruction even if the succeeding instruction uses the result register as its source (figure 8.36).

| | | | | | | | | | |
|--|----|----|----|----|----|----|---|---|-------------|
| Floating-point arithmetic operation instruction (single-precision) (FADD FR1,FR2) (latency 3) | IF | DF | E1 | E2 | SF | | | | |
| Next floating-point instruction (single-precision) (FMOV FR2,FR3) | | | | | | IF | — | — | DF EX NA SF |

Figure 8.35 Example of Use of FPU Operation Result by Succeeding Instruction

| | | | | | | | | | |
|---|----|----|----|----|----|--|--|--|--|
| Floating-point instruction (single-precision) (FMOV FR0,FR2) (latency 0) | IF | DF | EX | NA | SF | | | | |
| Next floating-point arithmetic operation instruction (single-precision) (FADD FR2,FR3) | IF | DF | E1 | E2 | SF | | | | |

Figure 8.36 Example of Use of Result of Zero-Latency Instruction as Source

When a register (FR0 to FR15) that stores the result of a floating-point arithmetic operation instruction is read (used as a source register) by a following FMOV or STS.L instruction, and the value is output to memory, latency is shortened by 1 cycle (figure 8.37).

| | | | | | | | | | |
|--|----|----|----|----|----|----|---|----------|--|
| Floating-point arithmetic operation instruction (single-precision) (FADD FR0,FR2) | IF | DF | E1 | E2 | SF | | | | |
| Next floating-point instruction (single-precision) (FMOV FR2,@R3) | | | | | | IF | — | DF EX NA | |

Figure 8.37 Example of Writing Result to Memory Immediately Following FPU Operation

When a register (FPUL) that stores the result of a floating-point arithmetic operation instruction is read (used as a source register) by a following STS instruction, and the value is output to the CPU, latency is shortened by 2 cycles (figure 8.38).

| | | | | | | | | | |
|--|----|----|----|----|----|--|--|--|--|
| Floating-point arithmetic operation instruction (single-precision) (FTRC FR0,FPUL) | IF | DF | E1 | E2 | SF | | | | |
| Next floating-point instruction (single-precision) (STS FPUL,R3) | | IF | DF | EX | NA | | | | |

Figure 8.38 Example of Transferring Result to CPU Immediately Following FPU Operation

The time required for the result of an FCMP instruction to be reflected in the T bit is 2 cycles in the case of single-precision, and 3 cycles in the case of double-precision. As a result, if that instruction (the following instruction) references the T bit, execution is delayed by the above slot interval (figure 8.39).

| | | | | | | | | |
|--|----|----|----|----|----|--|--|--|
| Instruction 1 (single-precision) (FCMP FR0,FR1) | IF | DF | E1 | E2 | | | | |
| Instruction 2 (instruction that references T bit) (BF) | | IF | — | ID | EX | | | |

Figure 8.39 Example of Referencing T Bit Immediately After FCMP Instruction

When the FPSCR value is changed using an LDS or LDS.L instruction, execution of the next instruction by a 3-slot interval (figure 8.40).

| | | | | | | | | | |
|------------------------------|----|----|----|----|----|----|----|----|----|
| Instruction 1 (LDS R2,FPSCR) | IF | DF | EX | NA | SF | | | | |
| Instruction 2 (FADD FR4,FR5) | | IF | — | — | — | DF | E1 | E2 | SF |

Figure 8.40 Example of Performing FPU Operation Immediately After FPSCR Load

When the FPSCR value is read using an STS or STS.L instruction, FPSCR is read after completion of the previously issued operation. As a result, execution is delayed by an interval of [latency of preceding operation + 1 slot] (figure 8.41).

| | | | | | | | | | | | |
|--|----|----|----|----|----|----|----|----|----|--|--|
| Instruction 1 (single-precision) (FADD FR6,FR9) | IF | DF | E1 | E2 | SF | | | | | | |
| Instruction 2 (STS FPSCR,R3) | | IF | — | — | — | DF | EX | NA | SF | | |

Figure 8.41 Example of Reading FPSCR

Double-precision floating-point arithmetic operation instructions (FADD, FSUB, FMUL) require 6 cycles for the E1 stage. Another floating-point arithmetic operation instruction will not enter the E1 stage during this interval. If another floating-point arithmetic operation instruction appears before a double-precision floating-point arithmetic operation instruction finishes the E1 stage, that floating-point arithmetic operation instruction has its execution delayed by a predetermined slot interval, and enters the E1 stage after the double-precision floating-point arithmetic operation instruction has finished the E1 stage. A floating-point load/store instruction arriving during this interval can be executed (figure 8.42).

| | | | | | | | | | | | |
|--------------|----|----|----|----|----|----|----|----|----|----|----|
| FADD DR4,DR6 | IF | DF | E1 | E1 | E1 | E1 | E1 | E1 | E2 | SF | |
| FABS DR0 | IF | DF | EX | NA | SF | | | | | | |
| STS FPUL,R0 | | IF | DF | EX | NA | | | | | | |
| FMUL DR2,DR0 | | IF | — | — | — | — | — | DF | E1 | E2 | SF |

Figure 8.42 Example of Double-Precision FPU Operation and Next FPU Instruction

With an FDIV or FSQRT instruction, after the E1 stage is used in initialization, operation is performed by an independent computer (ED stage), after which the operation result is written back. A floating-point arithmetic operation instruction following either of these instructions operates as described below. See section 8.9, Pipeline Operations for Each Instruction, for the kind of pipeline used with each instruction.

- (1) During E1 stage use in initialization, another floating-point arithmetic operation instruction will not enter the E1 stage. Other instructions enter the E1 stage after FDIV or FSQRT initialization ends.
- (2) After an FDIV or FSQRT instruction has progressed to the ED stage, an FPU instruction is executed without delay unless it uses the FDIV or FSQRT instruction result register (figure 8.40).

- (3) At the end of an FDIV or FSQRT instruction, operation write-back occurs. The E1 stage is used again here, and therefore if an instruction requests E1 stage operation from just this point onward, the subsequent instruction is kept waiting until the FDIV or FSQRT instruction finishes using the E1 stage (figure 8.44).
- (4) An FDIV or FSQRT instruction immediately following an FDIV or FSQRT instruction cannot enter the ED stage while the preceding FDIV or FSQRT instruction is using the ED stage.

Figure 8.43 Example 1 of E1 Stage Contention Due to FDIV

Figure 8.44 Example 2 of E1 Stage Contention Due to FDIV

If a write was performed by a previous instruction on a register used as a source register by a double-precision arithmetic operation instruction, and the latency of the previous instruction is 2 cycles or less, the latency of those instructions will be 2 (figure 8.45).

Figure 8.47 Example of No Latency Reduction with Double-Precision Arithmetic Operation Instruction

When a register (FR0 to FR15, or FPUL) that stores the result of a floating-point arithmetic operation instruction is written to (used as a destination register) by a following floating-point arithmetic operation instruction or floating-point load/store instruction, the next instruction is kept waiting before being executed. The number of cycles by which execution is delayed is [latency – 1] cycles if the preceding operation was FDIV or FSQRT, and [latency – 2] cycles otherwise (figures 8.48 and 8.49).

Figure 8.48 Example of Contention Due to Overwriting (FDIV, FSQRT)

| | | | | | | | | | | | |
|---|-----|----|----|----|----|--|--|--|--|--|--|
| Floating-point arithmetic operation instruction (single-precision) (FADD FR1,FR2) (latency 3 → latency 1) | ... | DF | E1 | E2 | SF | | | | | | |
| Next floating-point instruction (single-precision) (FMOV FR2,FR2) | — | DF | EX | NA | SF | | | | | | |

Figure 8.49 Example of Contention Due to Overwriting (Except FDIV, FSQRT)

If a write is performed by the following instruction on the register used as a source register by a double-precision FADD, FSUB, or FMUL, the following will be kept waiting for 2 cycles (figure 8.50).

| | | | | | | | | | | |
|---|----|----|----|----|----|----|----|----|----|----|
| Floating-point arithmetic operation instruction (double-precision) (FADD DR0,DR2) (latency 0 → latency 2) | IF | DF | E1 | E1 | E1 | E1 | E1 | E1 | E2 | SF |
| Next floating-point load/store instruction (single-precision) (FMOV FR4,FR1) | IF | — | — | DF | EX | NA | SF | | | |

Figure 8.50 Example of Write to Double-Precision Instruction Source Immediately after Double-Precision Operation

8.7 Contention Due to Multiplier

Multiply instructions, multiply-and-accumulate instructions, and instructions that manipulate the registers for these instructions (MACH, MACL) use the multiplier. In addition, the STS FPUL,Rn, and STS FPSCR,Rn instructions use the multiplication result read bus. Details of pipelining and contention are given below, with instructions divided into the categories shown. The numbers immediately following the instructions, in the form (A/B/C), indicate (number of execution slots/latency/number of lock slots).

- Multiply-and-accumulate instructions

| | | | | | | | | |
|---------------|----|----|----|----|----|----|----|----|
| MAC.L (4/6/5) | IF | ID | EX | MA | MA | mm | mm | mm |
| MAC.W (3/5/4) | IF | ID | EX | MA | MA | mm | mm | |
- Multiply instructions (I)

| | | | | | |
|-------------------------------|----|----|----|----|----|
| DMUL.S, DMUL.U, MUL.L (2/3/2) | IF | ID | mm | mm | mm |
| MULS.W, MULU.W(1/2/1) | IF | ID | mm | mm | |
- Multiply instructions (II) (register return)

| | | | | | | |
|--------------|----|----|----|----|----|----|
| MULR (2/4/2) | IF | ID | mm | mm | mm | WB |
|--------------|----|----|----|----|----|----|
- Register write instructions (I)

| | | | | |
|---------------------|----|----|----|----|
| CLRMAC, LDS (1/2/1) | IF | ID | mm | mm |
|---------------------|----|----|----|----|
- Register write instructions (II)

| | | | | | |
|---------------|----|----|----|----|----|
| LDS.L (1/3/2) | IF | ID | EX | MA | WB |
|---------------|----|----|----|----|----|
- Register read instructions (including STS FPUL,Rn and STS FPSCR,Rn)

| | | | | |
|---------------|----|----|----|----|
| STS (1/2/0) | IF | ID | EX | WB |
| STS.L (1/2/0) | IF | ID | EX | MA |

Facts about Contention

Contention arises with multi-cycle instructions in the same way as with general instructions (figure 8.51). See section 8.3.4, Details of Contention Due to Multi-Cycle Instruction, for details.

| | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|-------------|
| MAC.L @R1+,@R2+ | IF | ID | EX | MA | MA | mm | mm | mm |
| MAC.L @R3+,@R4+ | IF | — | — | — | ID | EX | MA | MA mm mm mm |

Note: MAC.L is an instruction with an execution rate of 4.

Figure 8.51 Example of Multi-Cycle Instructions Using Multiplier

The following rules apply to instructions that use the multiplier.

- (1) Execution of an instruction that uses a multiplication result as its source is delayed by an interval equivalent to the latency of that instruction (figure 8.52). If the following instruction is one that reads MACH or MACL, execution is delayed by [latency – 1] cycled (figure 8.53). If the following instruction is a multiply-and-accumulate instruction, execution is not delayed (figure 8.54).

| | | | | | | | | | |
|------|-------|----|----|----|----|----|----|----|----|
| MULR | R0,R4 | IF | ID | mm | mm | mm | WB | | |
| ADD | R4,R5 | IF | — | — | — | — | ID | EX | WB |

Figure 8.52 Example of Referencing Result Register Immediately after Multiplication (1)

| | | | | | | | | | |
|-------|---------|----|----|----|----|----|----|--|--|
| MUL.L | R2,R3 | IF | ID | mm | mm | mm | | | |
| STS | MACH,R4 | IF | — | — | ID | EX | WB | | |

Figure 8.53 Example of Referencing Result Register Immediately after Multiplication (2)

| | | | | | | | | | |
|-------|-----------|----|----|----|----|----|----|----|-------|
| MAC.W | @R1+,@R2+ | IF | ID | EX | MA | MA | mm | mm | |
| MAC.W | @R3+,@R4+ | IF | — | — | ID | EX | MA | MA | mm mm |

Figure 8.54 Example of Referencing Result Register Immediately after Multiplication (3)

- (2) In the case of an instruction after an instruction that uses the multiplier, if the preceding instruction locked the multiplier, execution is delayed until the multiplier is unlocked (figure 8.55).

| | | | | | | | | | |
|-------|---------------|----|--|----|----|----|----|----|----|
| MULR1 | lock interval | | | | | | | | |
| | | |  | | | | | | |
| MULR1 | R0,R1 | IF | ID | mm | mm | mm | WB | | |
| MULR2 | R0,R2 | IF | — | — | ID | mm | mm | mm | WB |

Figure 8.55 Example of Multiplier Lock Contention

However, if the following instruction is a multiply-and-accumulate instruction, it is executed after waiting for the same kind of state interval as with an ordinary multi-cycle instruction, rather than after waiting for the multiplier to be unlocked (figure 8.56).

(3) MULR instructions, STS instructions affecting MACH, MACL, FPUL, or FPSCR, and STS.L instructions affecting MACH or MACL share a result register read bus, causing resource contention (MA and WB stages). Therefore, parallel execution is not possible for STS and STS.L instructions (figure 8.59).

If an STS or STS.L is located immediately after a MULR instruction, WB stage contention occurs in the same way, and execution of the STS or STS.L instruction is delayed by 3 cycles (figure 8.60).

| | | | | | | | | | |
|-------|-----------|----|----|----|----|----|----|--|--|
| MUL.L | R1,R2 | IF | ID | mm | mm | mm | | | |
| STS | MACH,R3 | IF | — | — | ID | EX | WB | | |
| STS.L | MACL,@-R4 | IF | — | — | ID | EX | MA | | |

| MULR | R0,R3 | IF | — | — | ID | mm | mm | mm | WB |
| STS | MACH,R4 | IF | — | — | — | — | ID | EX | WB |

Figure 8.60 Example of Contention between MULR and STS

8.8 Programming Strategy

The following programming points should be noted in order to improve instruction execution speed.

- (1) A branch destination address should be at a longword boundary in memory. This enables parallel execution to be performed efficiently immediately after a branch.
- (2) The first 3 instructions immediately after an instruction that performs a load from memory should not include an instruction that uses the same register as the load instruction destination register. If possible, an instruction that uses the destination register should be no earlier than the fourth instruction after the load instruction.
- (3) The first 3 instructions immediately after a 32-bit multiply instruction should not include an instruction that uses the same register as the result register.
- (4) Instructions immediately following a floating-point arithmetic operation instruction, and having a latency between 1 and twice the latency of the floating-point arithmetic operation instruction, should not use the destination register of the floating-point arithmetic operation instruction.

8.9 Pipeline Operations for Each Instruction

Pipeline operations for each instruction are described below. In conjunction with the previously described rules and possibility of parallel execution, this information allows the program pipeline flow and number of instruction execution states to be calculated.

“Instruction A” in the following pipeline diagrams denotes the instruction being described.

The “Instruction Issuance” description indicates in particular how the instruction should be treated when taking resource contention into consideration.

The “Parallel Execution Capability” description indicates in particular how the instruction should be treated when taking parallel execution capability into consideration. Cases are described here in which there is no register contention.

The number of stages and number of execution states of an instruction are indicated using the format below. These tables show the number of states when the instruction is executed without register dependency.

Format of Number of Instruction Stages and Execution States

| Type | Category | Number of Stages | Execution States | Latency | Contention | Instructions |
|----------------------------|---|------------------------------|--|--|---------------------------------|--|
| Type according to function | Instructions are categorized according to differences of operation. | Number of instruction stages | Number of execution states when there is no contention | Number of execution states until execution result is confirmed | Resource contention that occurs | Applicable instructions, indicated by mnemonic |

Table 8.1 Number of Instruction Stages and Execution States

| Type | Category | Number of Stages | Execution States | Latency | Contention | Instructions |
|----------------------------|---|------------------|----------------------------------|----------------|------------|--------------------|

- Notes:
- 1 state when a branch is not performed.
 - Number of stages, execution states, and latency are shown in BO bit = 0/BO bit = 1 order.
 - Latency is shown in CPU register/FPU register order.
 - Latency is shown in the following order: in case of use as CPU register/single-precision register; in case of use as FRn even number side/single-precision register; in case of use as FRn odd number side/double-precision register.

8.9.1 Data Transfer Instructions

(1) Register-Register Transfer Instructions (MOV Rm,Rn)

Instruction Type

MOV Rm, Rn

Pipeline

Operation

The pipeline ends after three stages: IF, ID, EX. In the EX stage, data transfer is performed via the ALU.

Instruction Issuance

This instruction does not cause resource contention.

Parallel Execution Capability

This is a zero-latency instruction. Parallel execution is possible even when this instruction is executed as a preceding instruction and the succeeding instruction uses Rn.

(2) Register-Register Transfer Instructions (20-Bit Immediate Value)

Instruction Types

MOVI20 #imm20, Rn

MOVI20S #imm20, Rn

Pipeline

Operation

The pipeline ends after three stages: IF, ID, EX. In the EX stage, data transfer is performed via the ALU.

Instruction Issuance

These instructions do not cause resource contention.

Parallel Execution Capability

These are 32-bit instructions, and cannot be used in parallel execution. (See section 8.3.5, Details of Contention Due to 32-Bit Instruction.)

(3) Register-Register Transfer Instructions (Excluding MOV Rm,Rn, MOV120, and MOV120S)

Instruction Types

| | |
|--------|-----------------|
| MOV | #imm, Rn |
| MOVA | @(disp, PC), R0 |
| MOVT | Rn |
| MOVRT | Rn |
| SWAP.B | Rm, Rn |
| SWAP.W | Rm, Rn |
| XTRCT | Rm, Rn |
| NOTT | Rn |

Pipeline

Operation

The pipeline ends after three stages: IF, ID, EX. In the EX stage, data transfer is performed via the ALU.

Instruction Issuance

The SWAP.B, SWAP.W, and XTRCT instructions use the shifter.
The other instructions do not cause resource contention.

Parallel Execution Capability

No particular comments

(4) Memory Load Instructions

Instruction Types

```

MOV.W  @ (disp, PC), Rn
MOV.L  @ (disp, PC), Rn
MOV.B  @Rm, Rn
MOV.W  @Rm, Rn
MOV.L  @Rm, Rn
MOV.B  @Rm+, Rn
MOV.W  @Rm+, Rn
MOV.L  @Rm+, Rn
MOV.B  @-Rm, R0
MOV.W  @-Rm, R0
MOV.L  @-Rm, R0
MOV.B  @ (disp, Rm), R0
MOV.W  @ (disp, Rm), R0
MOV.L  @ (disp, Rm), Rn
MOV.B  @ (R0, Rm), Rn
MOV.W  @ (R0, Rm), Rn
MOV.L  @ (R0, Rm), Rn
MOV.B  @ (disp, GBR), R0
MOV.W  @ (disp, GBR), R0
MOV.L  @ (disp, GBR), R0

```

Pipeline

Operation

The pipeline has five stages: IF, ID, EX, MA, WB. Contention may occur if an instruction that uses the destination register of this instruction is among the three instructions following this instruction. (See section 8.5, Effect of Memory Load Instruction on Pipeline.)

Instruction Issuance

These instructions use the memory access pipeline.

Parallel Execution Capability

No particular comments

(5) Memory Load Instructions (12-Bit Displacement)

Instruction Types

MOV.B @ (disp12, Rm), Rn

MOV.W @ (disp12, Rm), Rn

MOV.L @ (disp12, Rm), Rn

MOVU.B @ (disp12, Rm), Rn

MOVU.W @ (disp12, Rm), Rn

Pipeline

Operation

The pipeline has five stages: IF, ID, EX, MA, WB. Contention may occur if an instruction that uses the destination register of this instruction is located within the 2 instructions following this instruction. (See section 8.5, Effect of Memory Load Instruction on Pipeline.)

Instruction Issuance

These instructions use the memory access pipeline.

Parallel Execution Capability

These are 32-bit instructions, and cannot be executed in parallel with a subsequent instruction. (See section 8.3.5, Details of Contention Due to 32-Bit Instruction.)

(7) Memory Store Instructions

Instruction Types

```

MOV.B   Rm, @Rn
MOV.W   Rm, @Rn
MOV.L   Rm, @Rn
MOV.B   Rm, @-Rn
MOV.W   Rm, @-Rn
MOV.L   Rm, @-Rn
MOV.B   R0, @Rn+
MOV.W   R0, @Rn+
MOV.L   R0, @Rn+
MOV.B   R0, @(disp, Rn)
MOV.W   R0, @(disp, Rn)
MOV.L   Rm, @(disp, Rn)
MOV.B   Rm, @(R0, Rn)
MOV.W   Rm, @(R0, Rn)
MOV.L   Rm, @(R0, Rn)
MOV.B   R0, @(disp, GBR)
MOV.W   R0, @(disp, GBR)
MOV.L   R0, @(disp, GBR)

```

Pipeline

Operation

The pipeline ends after four stages: IF, ID, EX, MA. There is no WB stage as there is no return of data to the register.

Instruction Issuance

These instructions use the memory access pipeline.

Parallel Execution Capability

No particular comments

(8) Memory Store Instructions (12-Bit Displacement)

Instruction Types

MOV.B Rm, @(disp12, Rn)

MOV.W Rm, @(disp12, Rn)

MOV.L Rm, @(disp12, Rn)

Pipeline

| | | | | | | |
|------------------------|----|----|----|----|-----|-------|
| | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
| Instruction A | IF | ID | EX | MA | | |
| Next instruction | IF | — | ID | EX | ... | |
| Instruction after next | | IF | ID | EX | ... | |

Operation

The pipeline ends after four stages: IF, ID, EX, MA. There is no WB stage as there is no return of data to the register.

Instruction Issuance

These instructions use the memory access pipeline.

Parallel Execution Capability

These are 32-bit instructions, and cannot be used in parallel execution. (See section 8.3.5, Details of Contention Due to 32-Bit Instruction.)

(9) Memory Store Instructions (MOVMU.L, MOVML.L)**Instruction Types**

MOVMU.L Rm, @-R15

MOVML.L Rm, @-R15

Pipeline

| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|------------------------|----|----|----|----|-----|----|----|-----|-----|-------|
| Instruction A | IF | ID | EX | MA | ... | MA | MA | MA | | |
| Next instruction | IF | — | — | — | ... | ID | EX | ... | | |
| Instruction after next | | IF | — | — | ... | — | ID | EX | ... | |

Operation

These instructions perform saving to the stack. The pipeline is in the form IF, ID, EX, MA, MA, MA, ... MA, with MA repeated as often as necessary. There is no WB stage as there is no return of data to the register.

Instruction Issuance

If there is an uncompleted instruction in the pipeline when these instructions are decoded, execution of these instructions will be delayed.

These instructions use the memory access pipeline.

Parallel Execution Capability

These are multi-cycle instructions, and cannot be executed in parallel with a subsequent instruction.

(10) PREF Instruction**Instruction Type**

PREF @Rm

Pipeline**Operation**

The pipeline ends after four stages: IF, ID, EX, MA. There is no WB stage as there is no return of data to the register.

Instruction Issuance

This instruction uses the memory access pipeline.

Parallel Execution Capability

No particular comments

8.9.2 Arithmetic Operation Instructions

(1) Inter-Register Arithmetic Operation Instructions (Excluding Multiply Instructions and DIVU or DIVS Instructions)

Instruction Types

| | |
|---------|----------|
| ADD | Rm, Rn |
| ADD | #imm, Rn |
| ADDC | Rm, Rn |
| ADDV | Rm, Rn |
| CMP/EQ | #imm, R0 |
| CMP/EQ | Rm, Rn |
| CMP/HS | Rm, Rn |
| CMP/GE | Rm, Rn |
| CMP/HI | Rm, Rn |
| CMP/GT | Rm, Rn |
| CMP/PZ | Rn |
| CMP/PL | Rn |
| CMP/STR | Rm, Rn |
| DIV1 | Rm, Rn |
| DIV0S | Rm, Rn |
| DIV0U | |
| DT | Rn |
| EXTS.B | Rm, Rn |
| EXTS.W | Rm, Rn |
| EXTU.B | Rm, Rn |
| EXTU.W | Rm, Rn |
| NEG | Rm, Rn |
| NEGC | Rm, Rn |
| SUB | Rm, Rn |
| SUBC | Rm, Rn |
| SUBV | Rm, Rn |
| CLIPU.B | Rn |
| CLIPU.W | Rn |

CLIP.B Rn

CLIP.W Rn

Pipeline

Operation

The pipeline ends after three stages: IF, ID, EX. In the EX stage, the data operation is completed via the ALU.

Instruction Issuance

The EXTS.B, EXTS.W, EXTU.B, and EXTU.W instructions use the shifter. The other instructions do not cause resource contention.

Parallel Execution Capability

With CLIP instructions, CS bit rewrite contention does not occur and parallel execution is possible.

(4) Multiply Instructions

Instruction Types

MULS.W Rm, Rn

MULU.W Rm, Rn

Pipeline

| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|------------------------|----|----|----|-----|-----|---|---|---|-------|
| Instruction A | IF | ID | mm | mm | | | | | |
| Next instruction | IF | ID | EX | ... | | | | | |
| Instruction after next | | IF | ID | EX | ... | | | | |

Operation

The pipeline ends after four stages: IF, ID, mm, mm. mm indicates a state in which the multiplier is operating.

See section 8.7, Contention Due to Multiplier, for general pipeline details. These instructions have one execution slot, a latency of two, and one lock state. Detailed examples where there are consecutive instructions relating to the pipeline of this instruction or the multiplier are given below.

(a) When a MULS.W instruction is immediately followed by a MAC.W or MAC.L instruction

There is no multiplier contention.

| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|------------------------|----|----|----|----|----|-----|----|---|---|-------|
| MULS.W | IF | ID | mm | mm | | | | | | |
| MAC.W | IF | ID | EX | MA | MA | mm | mm | | | |
| Instruction after next | | IF | — | ID | EX | ... | | | | |

- (b) When a MULS.W instruction is immediately followed by a MULS.W, MULU.W, DMULS.L, DMULU.L, MUL.L, MULR, STS (register), STS.L (memory), or LDS (register) instruction. As the MULS.W instruction locks the multiplier, parallel execution is not possible.

| | | | | | | | | |
|------------------------|----|----|----|----|-----|---|---|-------|
| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
| MULS.W Rm,Rn | IF | ID | mm | mm | | | | |
| STS MACL,Rn | IF | — | ID | EX | WB | | | |
| Instruction after next | | IF | ID | EX | ... | | | |

- (c) When a MULS.W instruction is immediately followed by an LDS.L (memory) instruction. Parallel execution with the MULS.W instruction is not possible, as it locks the multiplier.

| | | | | | | | | |
|------------------------|----|----|----|----|-----|----|---|-------|
| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
| MULS.W Rm,Rn | IF | ID | mm | mm | | | | |
| LDS.L @Rn+,MACL | IF | — | ID | EX | MA | WB | | |
| Instruction after next | | IF | ID | EX | ... | | | |

Instruction Issuance

These instructions use the multiplier.

These instructions lock the multiplier for a 1-slot interval.

Parallel Execution Capability

No particular comments

(5) Double-Precision Multiply Instructions

Instruction Types

DMULS.L Rm, Rn

DMULU.L Rm, Rn

MUL.L Rm, Rn

Pipeline

| | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|------------------------|----|----|----|----|-----|-------|
| Instruction A | IF | ID | mm | mm | mm | |
| Next instruction | IF | — | ID | EX | ... | |
| Instruction after next | | IF | — | ID | EX | ... |

Operation

The pipeline ends after five stages: IF, ID, mm, mm, mm. mm indicates a state in which the multiplier is operating.

See section 8.7, Contention Due to Multiplier, for general pipeline details. These instructions have two execution slots, a latency of three, and two lock states. Detailed examples where there are consecutive instructions relating to the pipeline of this instruction or the multiplier are given below.

- (a) When a MUL.L instruction is immediately followed by a MAC.W or MAC.L instruction
There is no multiplier contention.

| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|------------------------|----|----|----|----|----|----|----|-----|----|-------|
| MUL.L Rm,Rn | IF | ID | mm | mm | mm | | | | | |
| MAC.L @Rm+,@Rn+ | IF | — | ID | EX | MA | MA | mm | mm | mm | |
| Instruction after next | | IF | — | — | — | ID | EX | ... | | |

8.9.3 Logical Operation Instructions

(1) Register-Register Logical Operation Instructions

Instruction Types

| | |
|-----|----------|
| AND | Rm, Rn |
| AND | #imm, R0 |
| NOT | Rm, Rn |
| OR | Rm, Rn |
| OR | #imm, R0 |
| TST | Rm, Rn |
| TST | #imm, R0 |
| XOR | Rm, Rn |
| XOR | #imm, R0 |

Pipeline

Operation

The pipeline ends after three stages: IF, ID, EX. In the EX stage, the data operation is completed via the ALU.

Instruction Issuance

These instructions do not cause resource contention.

Parallel Execution Capability

No particular comments

(2) Memory Logical Operation Instructions

Instruction Types

AND.B #imm,@(R0,GBR)

OR.B #imm,@(R0,GBR)

XOR.B #imm,@(R0,GBR)

Pipeline

Operation

The pipeline ends after six stages: IF, ID, EX, MA, EX, MA.

Instruction Issuance

These instructions use the memory access pipeline.

Parallel Execution Capability

These are multi-cycle instructions, and cannot be executed in parallel with a subsequent instruction. (See section 8.3.4, Details of Contention Due to Multi-Cycle Instruction.)

(3) Memory Logical Operation Instructions

Instruction Type

TST.B #imm,@(R0,GBR)

Pipeline

| | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|------------------------|----|----|----|----|----|--------|
| Instruction A | IF | ID | EX | MA | EX | |
| Next instruction | IF | — | — | ID | EX | ... |
| Instruction after next | | IF | — | — | ID | EX ... |

Operation

The pipeline ends after five stages: IF, ID, EX, MA, EX.

Instruction Issuance

This instruction uses the memory access pipeline.

Parallel Execution Capability

This is a multi-cycle instruction, and cannot be executed in parallel with a subsequent instruction. (See section 8.3.4, Details of Contention Due to Multi-Cycle Instruction.)

(4) TAS Instruction

Instruction Type

TAS.B @Rn

Pipeline

| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|------------------------|----|----|----|----|----|-----|-------|
| Instruction A | IF | ID | EX | MA | EX | MA | |
| Next instruction | IF | — | — | ID | EX | ... | |
| Instruction after next | | IF | — | — | ID | EX | ... |

Operation

The pipeline ends after six stages: IF, ID, EX, MA, EX, MA.

Instruction Issuance

This instruction uses the memory access pipeline.

Parallel Execution Capability

This is a multi-cycle instruction, and cannot be executed in parallel with a subsequent instruction.

(5) Register-Register Bit Operation Instructions

Instruction Types

BLD #imm3, Rn
BSET #imm3, Rn
BCLR #imm3, Rn
BST #imm3, Rn

Pipeline

Operation

The pipeline ends after three stages: IF, ID, EX. In the EX stage, the data operation is completed via the ALU.

Instruction Issuance

These instructions do not cause resource contention.

Parallel Execution Capability

No particular comments

(6) Memory-Tbit Logical Operation Instructions

Instruction Types

```

BAND.B      #imm3,@(disp12,Rn)
BANDNOT.B   #imm3,@(disp12,Rn)
BLD.B       #imm3,@(disp12,Rn)
BLDNOT.B    #imm3,@(disp12,Rn)
BOR.B       #imm3,@(disp12,Rn)
BORNOT.B    #imm3,@(disp12,Rn)
BXOR.B      #imm3,@(disp12,Rn)

```

Pipeline

Operation

The pipeline ends after five stages: IF, ID, EX, MA, EX.

Instruction Issuance

These instructions use the memory access pipeline.

Parallel Execution Capability

These are 32-bit instructions, and cannot be used in parallel execution. If the instruction following this instruction is BAND.B, BANDNOT.B, BLD.B, BLDNOT.B, BOR.B, BORNOT.B, or BXOR, the final step is executed in parallel with the instruction that follows. Parallel execution with the final step is not possible with any other instruction. (See section 8.3.5, Details of Contention Due to 32-Bit Instruction).

| | | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|-----------|-------------------|----|----|----|----|----|-----|--------|
| BAND.B | #imm,@(disp12,Rn) | IF | ID | EX | MA | EX | | |

| Instruction after next | | | | IF | — | — | — | — |

(7) Memory Bit Operation Instructions

Instruction Types

BCLR.B #imm3,@(disp12,Rn)

BSET.B #imm3,@(disp12,Rn)

BST.B #imm3,@(disp12,Rn)

Pipeline

| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|------------------------|----|----|----|----|----|----|--------|
| Instruction A | IF | ID | EX | MA | EX | MA | |
| Next instruction | | IF | — | — | ID | EX | ... |
| Instruction after next | | IF | — | — | — | ID | EX ... |

Operation

The pipeline ends after six stages: IF, ID, EX, MA, EX, MA.

Instruction Issuance

These instructions use the memory access pipeline.

Parallel Execution Capability

These are 32-bit instructions, and cannot be used in parallel execution. (See section 8.3.5, Details of Contention Due to 32-Bit Instruction.)

8.9.4 Shift Instructions

Instruction Types

| | |
|--------|--------|
| ROTL | Rn |
| ROTR | Rn |
| ROTCL | Rn |
| ROTCR | Rn |
| SHAL | Rn |
| SHAR | Rn |
| SHLL | Rn |
| SHLR | Rn |
| SHLL2 | Rn |
| SHLR2 | Rn |
| SHLL8 | Rn |
| SHLR8 | Rn |
| SHLL16 | Rn |
| SHLR16 | Rn |
| SHAD | Rm, Rn |
| SHLD | Rm, Rn |

Pipeline

Operation

The pipeline ends after three stages: IF, ID, EX. In the EX stage, the data operation is completed via the shifter.

Instruction Issuance

These instructions use the shift pipeline.

Parallel Execution Capability

No particular comments

(a) When condition is met

The branch destination address is calculated in the EX stage. All overrun-fetched instructions up to that point are discarded. The branch destination instruction fetch is started from the slot following the instruction A EX stage slot.

(b) When condition is not met

If it is determined in the ID stage that the condition is not met, processing proceeds with nothing done in the EX stage. The next instruction is fetched and executed.

A typical pipeline is shown below.

If the preceding instruction is a CMP instruction, execution is delayed by 1 cycle.

If the preceding instruction is a single-precision FCMP instruction, execution is delayed by 2 cycles.

If the preceding instruction is a double-precision FCMP instruction, execution is delayed by 3 cycles.

Instruction Issuance

These instructions use the branch pipeline.

Parallel Execution Capability

No particular comments

(2) Delayed Conditional Branch Instructions

Instruction Types

BF/S label

BT/S label

Pipeline

(a) When condition is met

(b) When condition is not met

Operation

The pipeline ends after three stages: IF, ID, EX. Condition determination is performed in the ID stage. Interrupts are not accepted in the delay slot.

(a) When condition is met

The branch destination address is calculated in the EX stage. All overrun-fetched instructions up to that point are discarded. The branch destination instruction fetch is started from the slot following the instruction A EX stage slot.

(b) When condition is not met

If it is determined in the ID stage that the condition is not met, processing proceeds with nothing done in the EX stage. The next instruction is fetched and executed.

A typical pipeline is shown below.

If the preceding instruction is a CMP instruction, execution is delayed by 1 cycle.

| | | | | | | | |
|------------|----|----|----|----|----|---|-------|
| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
| CMP | IF | ID | EX | | | | |
| BF/S | IF | — | ID | EX | | | |
| Delay slot | | IF | — | — | ID | | |

If the preceding instruction is a single-precision FCMP instruction, execution is delayed by 2 cycles.

| | | | | | | | | |
|-------------|----|----|----|----|----|----|---|-------|
| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
| FCMP/single | IF | DF | E1 | E2 | | | | |
| BF/S | IF | — | — | ID | EX | | | |
| Delay slot | | IF | — | — | — | ID | | |

If the preceding instruction is a double-precision FCMP instruction, execution is delayed by 3 cycles.

| | | | | | | | | | |
|-------------|----|----|----|----|----|----|----|---|-------|
| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
| FCMP/double | IF | DF | E1 | E1 | E2 | | | | |
| BF/S | IF | — | — | — | ID | EX | | | |
| Delay slot | | IF | — | — | — | — | ID | | |

Instruction Issuance

These instructions use the branch pipeline.

If an instruction fetch has not yet been performed for the instruction (delay slot) immediately following one of these instructions, execution of that instruction is delayed.

Parallel Execution Capability

No particular comments

(3) Unconditional Branch Instructions

Instruction Types

```

BRA    label
BRAf   Rm
BSR    label
BSRf   Rm
JMP    @Rm
JSR    @Rm
RTS

```

Pipeline

| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots | |
|--------------------------------|----|----|-----------------------------|----|----|-----|-------|--|
| Instruction A | IF | ID | EX | | | | | |
| Delay slot | IF | — | — | ID | EX | ... | | |
| Instruction after next | | IF | ... (Fetched but discarded) | | | | | |
| Second instruction after next | | IF | ... (Fetched but discarded) | | | | | |
| Branch destination instruction | | | — | IF | ID | EX | ... | |

Operation

The pipeline ends after three stages: IF, ID, EX. Unconditional branch instructions are delayed branch instructions.

The branch destination address is calculated in the EX stage. The instruction after the unconditional branch instruction (instruction A) – that is, the delay slot instruction – is not discarded after being fetched, as with a conditional branch instruction, but is executed. However, the ID stage of this delay slot instruction is stalled for a 2-slot interval. The branch destination instruction fetch is started from the slot following the instruction A EX stage slot.

Interrupts are not accepted in the delay slot.

Instruction Issuance

These instructions use the branch pipeline.

If an instruction fetch has not yet been performed for the instruction (delay slot) immediately following one of these instructions, execution of that instruction is delayed.

Parallel Execution Capability

No particular comments

(4) No Delay Unconditional Branch Instructions

Instruction Types

JSR/N @Rm

RTS/N

RTV/N Rm

Pipeline

| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|--------------------------------|----|----|-----|-------------------------|----|----|-------|
| Instruction A | IF | ID | EX | | | | |
| Next instruction | IF | — | ... | (Fetched but discarded) | | | |
| Instruction after next | | IF | ... | (Fetched but discarded) | | | |
| Second instruction after next | | IF | ... | (Fetched but discarded) | | | |
| Branch destination instruction | | | — | IF | ID | EX | ... |

Operation

The pipeline ends after three stages: IF, ID, EX. Condition determination is performed in the ID stage. Conditional branch instructions are not delayed branch instructions. The branch destination address is calculated in the EX stage. All overrun-fetched instructions up to that point are discarded. The branch destination instruction fetch is started from the slot following the instruction A EX stage slot.

Instruction Issuance

These instructions use the branch pipeline.

Parallel Execution Capability

No particular comments

(5) Unconditional Branch Instructions with No Delay (JSR/N @@(disp,TBR))**Instruction Types**

JSR/N @@(disp,TBR)

Pipeline

| | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|--------------------------------|----|----|-----------------------------|----|----|--------------|
| Instruction A | IF | ID | EX | MA | EX | |
| Next instruction | IF | — | ... (Fetched but discarded) | | | |
| Instruction after next | | IF | ... (Fetched but discarded) | | | |
| Second instruction after next | | IF | ... (Fetched but discarded) | | | |
| Branch destination instruction | | | — | — | — | IF ID EX ... |

Operation

The pipeline ends after five stages: IF, ID, EX, MA, EX. Condition determination is performed in the ID stage. This is not a delayed branch instruction. The branch destination address is calculated in the second EX stage. All overrun-fetched instructions up to that point are discarded. The branch destination instruction fetch is started from the slot following the slot with the second EX of instruction A.

Instruction Issuance

This instruction uses the branch pipeline.

This instruction uses the memory access pipeline.

Parallel Execution Capability

| Instruction A | IF | ID | EX | MA | EX | EX | EX | |
| Next instruction | IF | — | — | — | — | ID | EX | ... |
| Instruction after next | | IF | — | — | — | — | ID | EX ... |

Operation

The pipeline ends after seven stages: IF, ID, EX, MA, EX, EX, EX.

Instruction Issuance

This instruction uses the memory access pipeline.

Parallel Execution Capability

This is a multi-cycle instruction, and cannot be executed in parallel with a subsequent instruction.

(6) STC.L Instructions

Instruction Types

STC.L GBR, @-Rn

STC.L VBR, @-Rn

STS.L PR, @-Rn

Pipeline

Operation

The pipeline ends after four stages: IF, ID, EX, MA.

Instruction Issuance

These instructions use the memory access pipeline.

Parallel Execution Capability

No particular comments

(8) Register → MAC Transfer Instructions**Instruction Types**

CLRMAC

LDS Rm, MACH

LDS Rm, MACL

Pipeline**Operation**

The pipeline ends after four stages: IF, ID, mm, mm. mm indicates a state in which the multiplier is operating.

See section 8.7, Contention Due to Multiplier, for general pipeline details. These instructions have one execution slot, a latency of two, and one lock state. Detailed examples where there are consecutive instructions relating to the pipeline of this instruction or the multiplier are given below.

- (a) When a CLRMAC instruction is immediately followed by a MAC.W or MAC.L instruction
There is no multiplier contention.

- (b) When a CLRMAC instruction is immediately followed by a MULS.W, MULU.W, DMULS.L, DMULU.L, MUL.L, MULR, STS (register), STS.L (memory), or LDS (register) instruction Parallel execution with the CLRMAC instruction is not possible, as it locks the multiplier.

- (c) When a CLRMAC instruction is immediately followed by an LDS.L (memory) instruction Execution is delayed for a CLRMAC instruction execution state (1-slot) interval.

Instruction Issuance

These instructions use the multiplier.

These instructions lock the multiplier for a 1-slot interval.

Parallel Execution Capability

No particular comments

- (b) When an LDS.L instruction is immediately followed by a MULS.W, MULU.W, DMULS.L, DMULU.L, MUL.L, MULR, STS (register), STS.L (memory), or LDS (register) instruction. As the LDS.L instruction locks the multiplier, stalling occurs a further 1-slot interval back.

| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|------------------------|----|----|----|----|----|-----|---|-------|
| LDS.L @Rm+,MACH | IF | ID | EX | MA | WB | | | |
| STS MACL,Rn | IF | — | — | ID | EX | WB | | |
| Instruction after next | | IF | — | ID | EX | ... | | |

- (c) When an LDS.L instruction is immediately followed by an LDS.L (memory) instruction. Execution is delayed for an LDS.L instruction execution state (1-slot) interval.

| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|------------------------|----|----|----|----|-----|----|---|-------|
| LDS.L @Rn+,MACH | IF | ID | EX | MA | WB | | | |
| LDS.L @Rn+,MACL | IF | — | ID | EX | MA | WB | | |
| Instruction after next | | IF | ID | EX | ... | | | |

Instruction Issuance

These instructions use the memory access pipeline.

These instructions use the multiplier.

These instructions are executed if there is a remaining multiplication lock interval of 1.

These instructions lock the multiplier for a 2-slot interval.

Parallel Execution Capability

No particular comments

- (b) When an STS instruction is immediately followed by a MULS.W, MULU.W, DMULS.L, DMULU.L, MUL.L, MULR, STS (register), STS.L (memory), or LDS (register) instruction. As the STS instruction does not lock the multiplier, parallel execution is performed.

- (c) When an STS instruction is immediately followed by a STS (register) or STS.L (memory) instruction.

Parallel execution is not possible, as contention occurs with the multiplication result read bus.

- (d) When an STS instruction is immediately followed by an LDS.L (memory) instruction

Parallel execution is performed.

There is no multiplier contention.

Instruction Issuance

These instructions use the multiplier, but do not lock it.
These instructions use the multiplication result read path.

Parallel Execution Capability

No particular comments

- (b) When an STS.L instruction is immediately followed by a MULS.W, MULU.W, DMULS.L, DMULU.L, MUL.L, MULR, STS (register), STS.L (memory), or LDS (register) instruction. As the STS.L instruction does not lock the multiplier, parallel execution is performed.

- (c) When an STS.L instruction is immediately followed by a STS (register) or STS.L (memory) instruction.

Parallel execution is not possible, as contention occurs with the multiplication result read bus.

- (d) When an STS.L instruction is immediately followed by an LDS.L (memory) instruction

Memory access pipeline contention occurs and parallel execution is not possible.

Instruction Issuance

These instructions use the memory access pipeline.

These instructions use the multiplier, but do not lock it.

These instructions use the multiplication result read path.

Parallel Execution Capability

No particular comments

(14) LDBANK Instruction**Instruction Type**

LDBANK @Rm, R0

Pipeline

| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|------------------------|----|----|----|----|----|----|----|----|--------|
| Instruction A | IF | ID | EX | EX | EX | EX | EX | EX | |
| Next instruction | IF | — | — | — | — | — | ID | EX | ... |
| Instruction after next | | IF | — | — | — | — | — | ID | EX ... |

Operation

The pipeline ends after eight stages: IF, ID, EX, EX, EX, EX, EX, EX.

Instruction Issuance

This instruction does not cause resource contention.

Parallel Execution Capability

This is a multi-cycle instruction, and cannot be executed in parallel with a subsequent instruction. (See section 8.3.4, Details of Contention Due to Multi-Cycle Instruction.)

(15) STBANK Instruction**Instruction Type**

STBANK R0, @Rn

Pipeline

| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|------------------------|----|----|----|----|----|----|----|----|----|----|--------|
| Instruction A | IF | ID | EX | EX | EX | EX | EX | EX | EX | EX | |
| Next instruction | IF | — | — | — | — | — | — | — | ID | EX | ... |
| Instruction after next | | IF | — | — | — | — | — | — | — | ID | EX ... |

Operation

The pipeline ends after nine stages: IF, ID, EX, EX, EX, EX, EX, EX, EX.

Instruction Issuance

This instruction does not cause resource contention.

Parallel Execution Capability

This is a multi-cycle instruction, and cannot be executed in parallel with a subsequent instruction. (See section 8.3.4, Details of Contention Due to Multi-Cycle Instruction.)

(16) TRAP Instruction

Instruction Type

TRAPA #imm

Pipeline

| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|------------------------|----|----|-----|-----|----|----|----|----|---|-------|
| Instruction A | IF | ID | EX | EX | EX | MA | MA | MA | | |
| Next instruction | IF | — | ... | | | | | | | |
| Instruction after next | | IF | — | ... | | | | | | |
| Branch destination | | | | | | | | | | IF |

Operation

The pipeline ends after eight stages: IF, ID, EX, EX, EX, MA, MA, MA. A TRAP instruction is not a delayed branch instruction. The IF stage of the branch destination instruction is started from the slot containing the third MA of the TRAP instruction.

Instruction Issuance

This instruction uses the memory access pipeline.

Parallel Execution Capability

This is a multi-cycle instruction, and cannot be executed in parallel with a subsequent instruction.

When there is banking and no overflow, saving to the bank is performed automatically. The pipeline ends after eight stages: IF, ID, EX, EX, MA, MA, MA, EX.

When there is banking and overflow, registers saved to the bank are automatically restored, and the BO bit is set to 1. The pipeline ends after 27 stages: IF, ID, EX, EX, MA, MA, MA, EX, MA, MA, MA, MA, MA, MA, MA, MA, MA, MA, MA, MA, MA, MA, MA, MA, MA, MA, MA. After the first two stages there are two repetitions of EX, three repetitions of MA, one EX, and 19 repetitions of MA.

Interrupt exception handling is not a delayed branch. The IF stage of the branch destination instruction is started from the slot containing the third MA stage of the interrupt exception handling.

Interrupt sources comprise external interrupt request pins such as NMI, a user break, and interrupts by on-chip peripheral modules.

Interrupt Acceptance

Interrupt exception handling is not accepted in a delay slot.

If a multi-cycle instruction is currently being executed, interrupt exception handling is not accepted until after execution of that instruction is completed. However, a DIVU or DIVS instruction can be canceled during execution, allowing the interrupt to be accepted.

(2) Address Error Exception Handling

Instruction Type

Address error exception handling

Pipeline

Operation

An address error is accepted in the ID stage of an instruction, and processing from that ID stage onward is replaced by the address error exception handling sequence.

The pipeline ends after seven stages: IF, ID, EX, EX, MA, MA, MA. Address error exception handling is not a delayed branch. The IF stage of the branch destination instruction is started from the slot containing the last MA stage of the address error exception handling.

Address error generation sources comprise those related to an instruction fetch, and those related to a data read or write. See the hardware manual for details of generation sources.

Address Error Exception Handling Acceptance

Address error exception handling is not accepted in a delay slot.

If a multi-cycle instruction is currently being executed, address error exception handling is not accepted until after execution of that instruction is completed. However, a DIVU or DIVS instruction can be canceled during execution, allowing address error exception handling to be accepted.

(4) FPU Exception Handling

Instruction Type

FPU exception handling

Pipeline

| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|------------------------|----|-----|-----|----|----|----|----|-------|
| FPU exception handling | IF | ID | EX | EX | MA | MA | MA | |
| Next instruction | IF | ... | | | | | | |
| Instruction after next | | IF | ... | | | | | |
| Branch destination | | | | | | | IF | ID |

Operation

An FPU execution is accepted in the ID stage of an instruction, and processing from that ID stage onward is replaced by the FPU exception handling sequence.

The pipeline ends after six stages: IF, ID, EX, MA, MA, MA. FPU exception handling is not a delayed branch. The IF stage of the branch destination instruction is started from the slot containing the last MA stage of the FPU exception handling.

Pipeline Processing of Instructions from Generation to Acceptance of FPU Exceptions

The FPU makes the instruction at which the execution occurred an NOP instruction, and also makes FPU instructions (excluding FCMP instructions) from occurrence of the execution to the instruction that accepts the exception NOP instructions. Consequently, FPU registers are not updated by instructions during this interval.

With FPU-related CPU instructions, as above, FPU registers are not updated (NOP operation is performed), but CPU registers are updated.

CPU instructions are not made NOP instructions, and operate as usual.

8.9.8 Floating-Point Instructions and FPU-Related CPU Instructions

(1) FPUL Load Instructions

Instruction Types

LDS Rm, FPUL

LDS.L @Rm+, FPUL

Pipeline

| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|------------------------|----|----|----|-----|-----|----|---|----------------|
| Instruction A | IF | ID | EX | MA | | | | : CPU pipeline |
| | | IF | DF | EX | NA | SF | | : FPU pipeline |
| Next instruction | IF | ID | EX | ... | | | | : CPU pipeline |
| | | IF | DF | ... | | | | : FPU pipeline |
| Instruction after next | | IF | ID | EX | ... | | | : CPU pipeline |
| | | | IF | DF | ... | | | : FPU pipeline |

Operation

The CPU pipeline ends after four stages – IF, ID, EX, MA – and the FPU pipeline after five stages – IF, DF, EX, NA, SF. Contention may occur if an instruction that reads FPUL is located within the 3 instructions following one of these instructions.

Instruction Issuance

These instructions use the FPU load/store pipeline and memory access pipeline.

There is no contention between an LDS instruction and a CPU memory read instruction.

Parallel Execution Capability

No particular comments

(2) FPSCR Load Instructions

Instruction Types

LDS Rm, FPSCR

LDS.L @Rm+, FPSCR

Pipeline

| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|------------------------|----|----|----|-----|-----|---|---|----------------|
| Instruction A | IF | ID | EX | MA | | | | : CPU pipeline |
| | IF | DF | EX | NA | SF | | | : FPU pipeline |
| Next instruction | IF | — | ID | EX | ... | | | : CPU pipeline |
| | IF | — | DF | ... | | | | : FPU pipeline |
| Instruction after next | | IF | ID | EX | ... | | | : CPU pipeline |
| | | IF | DF | ... | | | | : FPU pipeline |

Operation

The CPU pipeline ends after four stages – IF, ID, EX, MA – and the FPU pipeline after five stages – IF, DF, EX, NA, SF. A subsequent FPU-related instruction is stalled for the next 3 cycles.

Instruction Issuance

These instructions use the FPU load/store pipeline.

The LDS.L instruction also uses the memory access pipeline.

If an FPU arithmetic operation instruction is still performing calculation, these instructions are kept waiting until that instruction ends.

Parallel Execution Capability

These instructions cannot be executed in parallel with FPU instructions or FPU-related CPU instructions.

(3) FPUL Store Instruction (STS)

Instruction Type

STS FPUL, Rn

Pipeline

| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|------------------------|----|----|-----|-----|-----|-----|---|---|----------------|----------------|
| Instruction A | IF | ID | EX | WB | | | | | | : CPU pipeline |
| | IF | DF | EX | NA | | | | | | : FPU pipeline |
| Next instruction | IF | ID | EX | ... | | | | | | : CPU pipeline |
| | IF | DF | ... | | | | | | : FPU pipeline | |
| Instruction after next | | | IF | ID | EX | ... | | | | : CPU pipeline |
| | | | IF | DF | ... | | | | | : FPU pipeline |

Operation

The CPU pipeline ends after four stages – IF, ID, EX, WB – and the FPU pipeline after four stages – IF, DF, EX, NA. Contention may occur if an instruction that uses the destination of this instruction is located within the 3 instructions following this instruction.

Instruction Issuance

This instruction uses the multiplication result read path.

This instruction uses the FPU load/store pipeline and memory access pipeline.

There is no contention with a CPU memory write instruction.

If FPUL is waiting for the result of an FPU arithmetic operation, the latency of the previous instruction is reduced by 2. See section 8.6, Contention Due to FPU, for details.

Parallel Execution Capability

No particular comments

(4) FPUL Store Instruction (STS.L)

Instruction Type

STS.L FPUL, @-Rn

Pipeline

| Next instruction | IF | ID | EX | ... | | | | : CPU pipeline |
| | IF | DF | ... | | | | : FPU pipeline | |
| Instruction after next | | | IF | ID | EX | ... | | : CPU pipeline |
| | | | IF | DF | ... | | | : FPU pipeline |

Operation

The CPU pipeline ends after four stages – IF, ID, EX, MA – and the FPU pipeline after four stages – IF, DF, EX, NA.

Instruction Issuance

This instruction uses the FPU load/store pipeline and memory access pipeline.

If FPUL is waiting for the result of an FPU arithmetic operation, the latency of the previous instruction is reduced by 1. See section 8.6, Contention Due to FPU, for details.

Parallel Execution Capability

No particular comments

(5) FPSCR Store Instruction (STS)**Instruction Type**

STS FPSCR, Rn

Pipeline

| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|------------------------|----|----|----|-----|-----|---|---|---|----------------|
| Instruction A | IF | ID | EX | WB | | | | | : CPU pipeline |
| | IF | DF | EX | NA | | | | | : FPU pipeline |
| Next instruction | IF | — | ID | EX | ... | | | | : CPU pipeline |
| | IF | — | DF | ... | | | | | : FPU pipeline |
| Instruction after next | | IF | ID | EX | ... | | | | : CPU pipeline |
| | | IF | DF | ... | | | | | : FPU pipeline |

Operation

The CPU pipeline ends after four stages – IF, ID, EX, MA, WB – and the FPU pipeline after four stages – IF, DF, EX, NA.

Contention may occur if an instruction that uses the destination of this instruction is located within the 3 instructions following this instruction.

Instruction Issuance

This instruction uses the multiplication result read path.

If an FPU arithmetic operation instruction is still performing calculation, this instruction is kept waiting until that instruction ends.

Parallel Execution Capability

This instruction cannot be executed in parallel with FPU instructions or FPU-related CPU instructions.

(6) FPSCR Store Instruction (STS.L)**Instruction Type**

STS.L FPSCR, @-Rn

Pipeline

| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|------------------------|----|----|----|-----|-----|---|---|----------------|
| Instruction A | IF | ID | EX | MA | | | | : CPU pipeline |
| | | | | | | | | : FPU pipeline |
| Next instruction | IF | — | ID | EX | ... | | | : CPU pipeline |
| | IF | — | DF | ... | | | | : FPU pipeline |
| Instruction after next | | IF | ID | EX | ... | | | : CPU pipeline |
| | | IF | DF | ... | | | | : FPU pipeline |

Operation

The CPU pipeline ends after four stages – IF, ID, EX, MA – and the FPU pipeline after four stages – IF, DF, EX, NA.

Instruction Issuance

This instruction uses the FPU load/store pipeline and memory access pipeline.

If an FPU arithmetic operation instruction is still performing calculation, this instruction is kept waiting until that instruction ends.

Parallel Execution Capability

This instruction cannot be executed in parallel with FPU instructions or FPU-related CPU instructions.

(7) Some floating-point register-register transfer instructions, floating-point register-immediate instructions, and floating-point operation instructions

Instruction Types

| | |
|-------|-----------|
| FLDS | FRm, FPUL |
| FMOV | FRm, FRn |
| FSTS | FPUL, FRn |
| FLDI0 | FRn |
| FLDI1 | FRn |
| FABS | FRn |
| FNEG | FRn |
| FABS | DRn |
| FNEG | DRn |

Pipeline

| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|------------------------|----|----|----|-----|-----|----|---|----------------|
| Instruction A | IF | ID | EX | | | | | : CPU pipeline |
| | IF | DF | EX | NA | SF | | | : FPU pipeline |
| Next instruction | IF | ID | EX | ... | | | | : CPU pipeline |
| | IF | DF | E1 | E2 | SF | | | : FPU pipeline |
| Instruction after next | | IF | ID | EX | ... | | | : CPU pipeline |
| | | IF | DF | E1 | E2 | E3 | | : FPU pipeline |

Operation

The CPU pipeline ends after three stages – IF, ID, EX – and the FPU pipeline after five stages – IF, DF, EX, NA, SF. Contention does not occur even if one of these instructions is immediately followed by an instruction that reads the destination of that instruction.

Instruction Issuance

These instructions use the FPU load/store pipeline.

Parallel Execution Capability

These are zero-latency instructions. Parallel execution is possible even if one of these instructions is executed as a preceding instruction and the succeeding instruction uses FRn, FPUL.

(8) Double-Precision Floating-Point Register to Register Data Transfer Instructions

Instruction Types

FMOV DRm, DRn

Pipeline

| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Slots |
|------------------------|----|-----|----|----|-----|----|---|----------------|
| Instruction A | IF | ID | EX | EX | | | | : CPU pipeline |
| | IF | DF | EX | EX | NA | SF | | : FPU pipeline |
| Next instruction | IF | ... | ID | EX | ... | | | : CPU pipeline |
| | IF | ... | DF | E1 | E2 | SF | | : FPU pipeline |
| Instruction after next | IF | ... | ID | EX | ... | | | : CPU pipeline |
| | IF | ... | DF | E1 | E2 | SF | | : FPU pipeline |

Operation

The CPU pipeline ends after four stages – IF, ID, EX, EX – and the FPU pipeline after six stages – IF, DF, EX, EX, NA, SF. Contention does not occur even if one of these instructions is immediately followed by an instruction that reads the destination of that instruction.

Instruction Issuance

This instruction uses the FPU load/store pipeline.

Parallel Execution Capability

(10) Floating-Point Register Load Instructions

Instruction Types

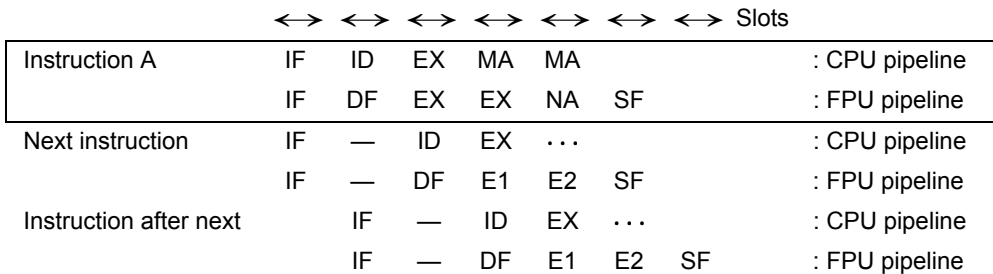

FMOV.S @Rm, FRn
 FMOV.S @Rm+, FRn
 FMOV.S @(R0, Rm), FRn
 FMOV.D @Rm, DRn
 FMOV.D @Rm, DRn
 FMOV.D @(R0, Rm), DRn

Pipeline

- Single-Precision

- Double-Precision

Operation

- Single-Precision

The CPU pipeline ends after four stages – IF, ID, EX, MA – and the FPU pipeline after five stages – IF, DF, EX, NA, SF. Contention may occur if an instruction that reads the destination of one of these instructions is located within the 3 instructions following that instruction.

- Double-Precision

The CPU pipeline ends after five stages – IF, ID, EX, MA, MA – and the FPU pipeline after six stages – IF, DF, EX, EX, NA, SF. Contention may occur if an instruction that reads the destination of one of these instructions is located within the 5 instructions following that instruction.

Instruction Issuance

These instructions use the FPU load/store pipeline and memory access pipeline.

Parallel Execution Capability

FMOV.D instruction is a multi-cycle instruction, and cannot be executed in parallel with a subsequent instruction. (See section 8.3.4, Details of Contention Due to Multi-Cycle Instruction.)

(11) Floating-Point Register Load Instruction (12-Bit Displacement)**Instruction Type**

FMOV.S @ (disp12, Rm), FRn

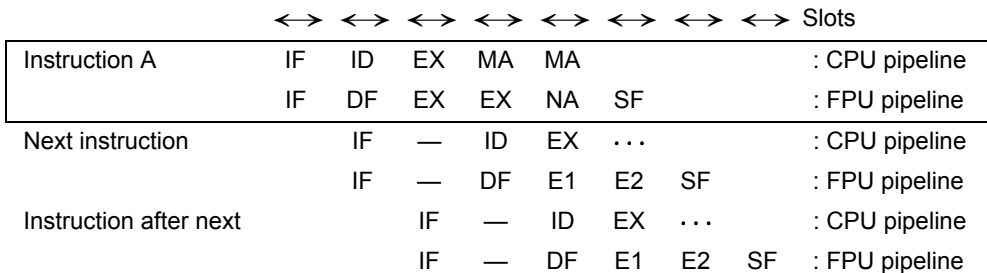

FMOV.D @ (disp12, Rm), DRn

Pipeline

- Single-Precision

- Double-Precision

**Operation**

- Single-Precision

The CPU pipeline ends after four stages – IF, ID, EX, MA – and the FPU pipeline after five stages – IF, DF, EX, NA, SF. Contention may occur if an instruction that reads the destination of this instruction is located within the 3 instructions following this instruction.

- Double-Precision

The CPU pipeline ends after five stages – IF, ID, EX, MA, MA – and the FPU pipeline after six stages – IF, DF, EX, EX, NA, SF. Contention may occur if an instruction that reads the destination of this instruction is located within the 3 instructions following this instruction.

Instruction Issuance

These instructions use the FPU load/store pipeline and memory access pipeline.

Parallel Execution Capability

This is a 32-bit instruction, and cannot be used in parallel execution. (See section 8.3.5, Details of Contention Due to 32-Bit Instruction.)

(12) Floating-Point Register Store Instructions

Instruction Types

FMOV.S FRm, @Rn
 FMOV.S FRm, @-Rn
 FMOV.S FRm, @ (R0, Rn)
 FMOV.D DRm, @Rn
 FMOV.D DRm, @-Rn
 FMOV.D DRm, @ (R0, Rn)

Pipeline

- Single-Precision

- Double-Precision

Operation

- Single-Precision

The CPU pipeline ends after four stages – IF, ID, EX, MA – and the FPU pipeline after four stages – IF, DF, EX, NA.

- Double-Precision

The CPU pipeline ends after five stages – IF, ID, EX, MA, MA – and the FPU pipeline after five stages – IF, DF, EX, EX, NA.

Instruction Issuance

These instructions use the FPU load/store pipeline and memory access pipeline.

Parallel Execution Capability

FMOV.D instruction is a multi-cycle instruction, and cannot be executed in parallel with a subsequent instruction. (See section 8.3.4, Details of Contention Due to Multi-Cycle Instruction.)

(13) Floating-Point Register Store Instruction (12-Bit Displacement)**Instruction Type**

FMOV.S FRm, @(disp12, Rn)

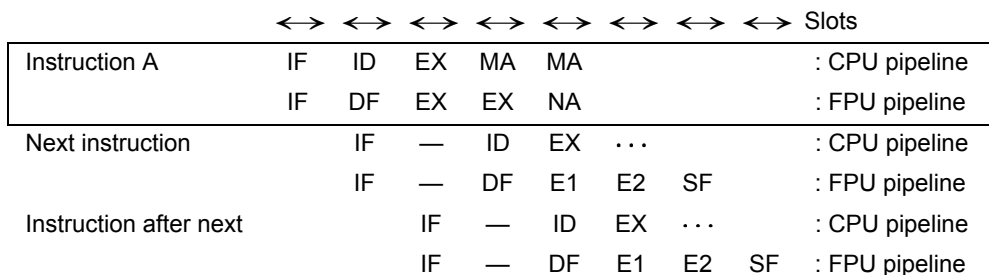

FMOV.D DRm, @(disp12, Rn)

Pipeline

- Single-Precision

- Double-Precision

**Operation**

- Single-Precision

The CPU pipeline ends after four stages – IF, ID, EX, MA – and the FPU pipeline after four stages – IF, DF, EX, NA.

- Double-Precision

The CPU pipeline ends after five stages – IF, ID, EX, MA, MA – and the FPU pipeline after five stages – IF, DF, EX, EX, NA.

Instruction Issuance

These instructions use the FPU load/store pipeline and memory access pipeline.

Parallel Execution Capability

This is a 32-bit instruction, and cannot be used in parallel execution. (See section 8.3.5, Details of Contention Due to 32-Bit Instruction.)

Operation

- Single-Precision

The CPU pipeline ends after three stages – IF, ID, EX – and the FPU pipeline after five stages – IF, DF, E1, E2, SF. Contention may occur if an instruction that reads the destination of one of these instructions is located within the 5 instructions following that instruction.

- Double-Precision

The CPU pipeline ends after three stages – IF, ID, EX – and the FPU pipeline after 10 stages – IF, DF, E1, E1, E1, E1, E1, E1, E2, SF. Contention may occur if an instruction that reads the destination of one of these instructions is located within the 15 instructions following that instruction.

Instruction Issuance

These instructions use the FPU arithmetic operation pipeline. See section 8.6, Contention Due to FPU, for details of contention.

Parallel Execution Capability

No particular comments

Operation

- Single-Precision

The CPU pipeline ends after three stages – IF, ID, EX – and the FPU pipeline after five stages – IF, DF, E1, E2, SF. Contention may occur if an instruction that reads the destination of one of these instructions is located within the 5 instructions following that instruction.

- Double-Precision

The CPU pipeline ends after three stages – IF, ID, EX – and the FPU pipeline after six stages – IF, DF, E1, E1, E2, SF. Contention may occur if an instruction that reads the destination of one of these instructions is located within the 7 instructions following that instruction.

Instruction Issuance

These instructions use the FPU arithmetic operation pipeline. See section 8.6, Contention Due to FPU, for details of contention.

Parallel Execution Capability

No particular comments

Operation

- Single-Precision

The CPU pipeline ends after three stages – IF, ID, EX – and the FPU pipeline after 14 stages – IF, DF, E1, ED, ED, ED, ED, ED, ED, ED, ED, ED, E1, E2, SF. That is to say, after one E1 stage has been performed, the ED stage is repeated 8 times, followed by E1, E2, and SF.

- Double-Precision

The CPU pipeline ends after three stages – IF, ID, EX – and the FPU pipeline after 27 stages – IF, DF, E1, E1, ED, ED, ED, ED, ED, ED, ED, ED, ED, ED, ED, ED, ED, ED, ED, ED, ED, E1, E1, E1, E2, SF. That is to say, after the E1 stage has been performed twice, the ED stage is repeated 18 times, followed by E1, E1, E1, E2, and SF.

The contention described in section 8.6, Contention Due to FPU, occurs. If there is an overlapping instruction that accesses the FDIV result register in the FDIV pipeline, that instruction is kept waiting until execution of the FDIV instruction is finished. Stages from E1 onward are stalled until the end of FDIV execution, and subsequent instructions are also subject to stalling. Therefore, if a floating-point instruction that uses the FDIV result register, or an FPU-related CPU instruction, is not located within 21 instructions immediately after the FDIV instruction in the case of single-precision, or 49 instructions in the case of double-precision, a CPU instruction or another FPU instruction can be executed during that interval, enabling performance to be improved.

Instruction Issuance

These instructions use the FPU arithmetic operation pipeline. See section 8.6, Contention Due to FPU, for details of contention.

The ED stages of these instructions operate in states, without regard to slots.

Parallel Execution Capability

No particular comments

Operation

- Single-Precision

The CPU pipeline ends after three stages – IF, ID, EX – and the FPU pipeline after 13 stages – IF, DF, E1, ED, ED, ED, ED, ED, ED, ED, ED, E1, E2, SF. That is to say, after one E1 stage has been performed, the ED stage is repeated 7 times, followed by E1, E2, and SF.

- Double-Precision

The CPU pipeline ends after three stages – IF, ID, EX – and the FPU pipeline after 26 stages – IF, DF, E1, E1, ED, ED, ED, ED, ED, ED, ED, ED, ED, ED, ED, ED, ED, ED, ED, ED, ED, E1, E1, E1, E2, SF. That is to say, after the E1 stage has been performed twice, the ED stage is repeated 17 times, followed by E1, E1, E1, E2, and SF.

The contention described in section 8.6, Contention Due to FPU, occurs. If there is an overlapping instruction that accesses the FSQRT result register in the FSQRT pipeline, that instruction is kept waiting until execution of the FSQRT instruction is finished. Stages from E1 onward are stalled until the end of FSQRT execution, and subsequent instructions are also subject to stalling. Therefore, if a floating-point instruction that uses the FSQRT result register, or an FPU-related CPU instruction, is not located within 19 instructions immediately after the FSQRT instruction in the case of single-precision, or 47 instructions in the case of double-precision, a CPU instruction or another FPU instruction can be executed during that interval, enabling performance to be improved.

Instruction Issuance

These instructions use the FPU arithmetic operation pipeline. See section 8.6, Contention Due to FPU, for details of contention.

The ED stages of these instructions operate in states, without regard to slots.

Parallel Execution Capability

| | IF | — | — | — | DF | ... | | | : FPU pipeline |

Instruction Issuance

These instructions use the FPU arithmetic operation pipeline.

Parallel Execution Capability

Parallel execution of a double-precision FCMP instruction and the following instruction is not possible.

8.10 Simple Method of Calculating Required Number of Clock Cycles

A simple method of calculating required number of clock cycles is described below. This method provides a rough approximation, but it allows the user to calculate the number of clock cycles needed to execute the target instruction string.

The calculation is based on the following rules.

- (1) The instructions are assumed to already have been fetched, so fetch time is not taken into consideration.
- (2) The 32-bit instructions operate in “execution state” cycles.
- (3) If resource contention occurs, the previously issued instructions operate in “execution state” cycles. Parallel execution of subsequent instructions is not possible.
- (4) If the result from the previously issued instruction is used by the instruction that immediately follows, the calculation assumes that the previously issued instruction will require “latency” cycles.
- (5) If the result from the previously issued instruction is not used by the instruction that immediately follows, the calculation assumes that the previously issued instruction will require “execution state” cycles.
- (6) Correction for parallel execution is performed in simplified form as a compensation item.

There are a large number of exceptional cases, so the calculation method introduced here cannot be 100% accurate. It does allow the user to obtain a rough idea of the number of clock cycles that will be required, however. Examples are provided below.

1. Counting Latency Cycles

| | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | ↔ | Cycles |
|----------------|---|----|----|----|----|----|----|---|--------|
| MOV.L @ R1, R0 | | ID | EX | MA | WB | | | | 2 |
| ADD # imm, R0 | | — | — | ID | EX | | | | 1 |
| MOV.L R0, @ R1 | | | — | | ID | EX | MA | | |

The result from MOV.L, which precedes ADD, will be used, so the calculation assumes that MOV.L will require “latency” cycles (two cycles) to execute. The next MOV.L instruction uses the result from ADD, so the calculation assumes that the ADD instruction will require “latency” execution (one cycle).

2. Counting Execution State Cycles

In this case, the result from the previously issued instruction is not used by the instructions that follow it, so the instructions execute in parallel provided no resource contention occurs. The number of cycles required by each instruction to execute are calculated in the “execution state.” When the preceding instruction uses one execution state cycle, the following instruction executes in parallel. When parallel execution takes place, the number of cycles required by the preceding instruction is calculated as “execution state” minus one. This serves as a simplified compensation. (This compensation appears as the final item in the equation introduced below.)

3. If Resource Contention Occurs

If resource contention occurs, parallel execution is not possible. The execution of each instruction requires “execution state” cycles.

4. Instructions Using More Than One Execution State

For instructions using more than one execution state, the calculation assumes that the number of remaining states is reduced one by one until only one remains, at which point parallel execution with the subsequent instructions is possible. In this case, the number of cycles required for execution is calculated as “execution state” minus one if parallel execution with subsequent instructions takes place, and as “execution state” if no parallel execution takes place. This serves

as a simplified compensation. (This compensation appears as the final item in the equation introduced below.)

Based on the above, the number of cycles necessary to execute the entire instruction string is as summarized below, in extremely simplified terms. If some portions of the string have dependencies and others do not, separate calculations should be made for each portion and the results added together.

- If Dependencies Exist Between Instructions
Required number of cycles = sum total of “latency” cycles of all instructions
- If No Dependencies Exist Between Instructions
Required number of cycles = sum total of “execution state” cycles of all instructions – (total number of instructions – number of instructions that cannot be executed in parallel) ÷ 2

In this case, “number of instructions that cannot be executed in parallel” is the total number of instructions that cannot be executed in parallel due to resource contention (in particular, memory access instructions that immediately follow another memory access instruction), instructions using more than one execution state, and 32-bit instructions

The final item compensates for the effects of parallel execution by reducing the number of required cycles for the preceding instructions.

Example: If Dependencies Exist Between Instructions

```
BAND.B
ROTCL
BAND.B
ROTCL
```

The “latency” cycles for all instructions are added together, producing a total of eight cycles.

Example: If No Dependencies Exist Between Instructions

```
ADD      # imm, R0
BAND.B   # imm, @(disp12,R2)
MULR     R4, R0
ROTCL     R5
```

$$\begin{aligned} \text{Required number of cycles} &= 1 + 3 + 2 + 1 - (4 - 2) \div 2 \\ &= 7 - 1 = 6 \text{ cycles} \end{aligned}$$

Appendix A SH-2A/SH2A-FPU Parallel Execution

The table below can be used to determine whether or not parallel execution is supported, depending on the type of arithmetic unit used. In the case of instructions that belong to more than one category, parallel execution is supported if all of the applicable intersections are marked with a circle (o).

| | | Second instruction | | | | | | | | | | |

- The first and last steps of multi-step instructions are executed in parallel.
- FPU instructions follow the SH4 classifications ((1) LS type, (2) FE type, (3) CO type). The new 32-bit FMOV instructions belong to the (1) LS type.
- As a rule, 32-bit instructions are executed in parallel if the preceding instruction is a multi-step instruction. They cannot be executed in parallel with the instructions that follow them. However, pairs of memory-Tbit bit-manipulation instructions are executed in parallel.
- The MOVMU.L and MOVML.L instructions cannot be executed in parallel with the instructions that follow them.
- Parallel execution of delayed branch instructions and delayed slots is not supported.

Multi-step instructions:

TRAPA, MOVMU.L, MOVML.L, AND.B, OR.B, TST.B, XOR.B, TAS.B, BCLR.B, BSET.B, BST.B, BAND.B, BANDNOT.B, BLD.B, BLDNOT.B, BOR.B, BORNOT.B, BXOR.B, MUL.L, DMULS.L, DMULU.L, MULR, DIVU, DIVS, FCMP/EQ DRm,DRn, FCMP/GT DRm,DRn, LDC Rm,SR, STC SR,Rn, LDC.L @Rm+,SR, STC.L SR,@-Rn, LDBANK, STBANK, RESBANK, FMOV.D, FMOV DRm,DRn, JSR/N @@(disp,TBR), SLEEP, RTE, MAC.W, MAC.L

32-bit instructions:

MOVI20, MOVI20S, MOV.B @(disp12,Rm),Rn, MOV.W @(disp12,Rm),Rn, MOV.L @(disp12,Rm),Rn, MOV.B Rm,@(disp12,Rn), MOV.W Rm,@(disp12,Rn), MOV.L Rm,@(disp12,Rn), MOVU.B, MOVU.W, FMOV.S @(disp12,Rm),FRn, FMOV.D @(disp12,Rm),DRn, FMOV.S FRm,@(disp12,Rn), FMOV.D DRm,@(disp12,Rn), BCLR.B, BSET.B, BST.B, BAND.B, BANDNOT.B, BLD.B, BLDNOT.B, BOR.B, BORNOT.B, BXOR.B

32-bit FMOV instructions:

FMOV.S @(disp12,Rm),FRn, FMOV.D @(disp12,Rm),DRn, FMOV.S FRm,@(disp12,Rn), FMOV.D DRm,@(disp12,Rn),

Memory-Tbit bit-manipulation instructions:

BAND.B, BANDNOT.B, BLD.B, BLDNOT.B, BOR.B, BORNOT.B, BXOR.B

Delayed branch instructions:

BRA, BSR, BRAF, BSRF, JMP, JSR, RTS, RTE, BT/S, BF/S

Appendix B Programming Guidelines (Using MOVI20 and MOVI20S)

In the SH-2A/SH2A-FPU, the MOVI20 #imm20,Rn and MOVI20S #imm20,Rn instructions reduce literal access by PC-relative instructions and increase cycle performance. Use of a declaration of the sort shown below in the assembler is recommended in order to gain these benefits.

(1) Using MOVI20

MOVI20 performs sign extension. This instruction can be used to express the range H'00000000 to H'0007FFFF and H'FFF80000 to H'FFFFFFF.

The following instruction string should be arranged continuously.

```
MOVI20 #imm20, Rn  
Unconditional branch instruction*
```

Example:

```
MOVI20 #imm20, Rn  
JMP @ Rm
```

(2) Using MOVI20S

MOVI20S performs sign extension. This instruction can be used with ADD #imm, Rn to express the range H'00000000 to H'07FFFF7F and H'F7FFFF80 to H'FFFFFFF.

The following instruction string should be arranged continuously.

```
MOVI20S #imm20, Rn  
ADD#imm, Rn  
Unconditional branch instruction*
```

Example:

```
MOVI20S#imm20, Rn  
ADD#imm, Rn  
JMP @ Rm
```

Notes: To specify addresses in the range H'07FF FF80–H'07FF FFFF:

MOVI20S #imm20, R0

OR #imm, R0

Unconditional branch instruction*

Alternately, use a 32-bit address read as follows:

MOV.L @(disp, PC), Rn

Unconditional branch instruction*

* Unconditional branch instruction: BRAF Rm, BSRF Rm, JMP @Rm, JSR @Rm, JSR/N @Rm
