**Attention please!**

The information herein is given to describe certain components and shall not be considered as a guarantee of characteristics.

Terms of delivery and rights to technical change reserved.

We hereby disclaim any and all warranties, including but not limited to warranties of non-infringement, regarding circuits, descriptions and charts stated herein.

**Information**

For further information on technology, delivery terms and conditions and prices please contact your nearest Infineon Technologies Office ([www.infineon.com](http://www.infineon.com)).

**Warnings**

Due to technical requirements components may contain dangerous substances. For information on the types in question please contact your nearest Infineon Technologies Office.

Infineon Technologies Components may only be used in life-support devices or systems with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system, or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body, or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.

## **1 Summary of Features**

- High Performance 32-bit TriCore™ V1.3 CPU with 4-Stage Pipeline
- Floating Point Unit (FPU)
- Dual Issue super-scalar implementation
  - MAC Instruction maximum triple issue
- Circular Buffer and bit-reverse addressing modes for DSP algorithms
- Very fast interrupt response time
- Hardware controlled context switch for task switch and interrupts
- Memory Management Unit (MMU)
- On-chip Memory
  - 28-Kbyte Data Memory (SPRAM)
  - 32-Kbyte Code Memory (SPRAM)
  - 16-Kbyte Instruction Cache (ICACHE)
  - 4-Kbyte Data Cache (DCACHE)
  - 64-Kbyte SRAM Data Memory Unit (DMU)
  - 16-Kbyte Boot ROM
- On-chip Bus Systems
  - 64-bit High Performance Local Memory Bus (LMB) for fast access between caches and on-local memories and FPI Interface
  - On-chip Flexible Peripheral Interconnect Bus (FPI) for interconnections of functional units
- DMA Controller with 8 channels for data transfer operations between peripheral units and memory locations
- Two high speed Micro Link Interfaces (MLI0/1) for controller communication and emulation
- Flexible External Bus Interface Unit (EBU) to access external data memories
- One Multifunctional General Purpose Timer Unit (GPTU) with three 32-bit timer/counters
- Two Capture and Compare units (CCU60/1) for PWM signal generation, each with
  - 3-channel, 16 bit Capture and Compare unit
  - 1-channel, 16 bit Compare unit
- Three Asynchronous/Synchronous Serial Channels (ASC0/1/2) with baud-rate generator, parity, framing and overrun error detection, support FIFO and IrDA data transmission
- Two High Speed Synchronous Serial Channels (SSC0/1) with programmable data length, FIFO support and shift direction

---

**Advance Information****Summary of Features**

- One MultiCAN module with four CAN nodes and 128 message buffers for high efficiency data handling
- Inter-IC (IIC) module with two physical IIC buses
- Digital I/O ports with 3.3 V I/O capabilities
- Level 2 On-chip Debug Support
- Power Management System
- Clock Generation Unit with PLL
- Maximum CPU and Bus clock frequency at 150 MHz without MMU and 120 MHz with MMU
- Ambient temperature under bias: -40° to +85°C
- P-LBGA-208 package

**Advance Information**
**General Device Information**
**Table 2-1 Pin Definitions and Functions (cont'd)**

<b>Symbol</b>	<b>Pin</b>	<b>In Out</b>	<b>PU/ PD<sup>1)</sup></b>	<b>Functions</b>
<b>HDRST</b>	N5	I/O	PUA	<b>Hardware Reset Input/Reset Indication Output</b> Assertion of this bi-directional open-drain pin causes a synchronous reset of the chip through external circuitry. This pin must be driven for a minimum $4f_{CPU}$ clock cycles. The internal reset circuitry drives this pin in response to a power-on, hardware, watchdog and power-down wake-up reset for a specific period of time. For a software reset, activation of this pin is programmable.
<b>PORST</b>	R5	I	PUC	<b>Power-on Reset Input</b> A low level on $\overline{PORST}$ causes an asynchronous reset of the entire chip. $\overline{PORST}$ is a fully asynchronous level sensitive signal.
<b>NMI</b>	T7	I	PUC	<b>Non-Maskable Interrupt Input</b> A high-to-low transition on this pin causes an NMI-Trap request to the CPU.
<b>TRST</b>	T11	I	PDC	<b>JTAG Module Reset/Enable Input</b> A low level at this pin resets and disables the JTAG module. A high level enables the JTAG module.
<b>TCK</b>	T12	I	PUC	<b>JTAG Module Clock Input</b>
<b>TDI</b>	T13	I	PUC	<b>JTAG Module Serial Data Input</b>
<b>TDO</b>	T10	O	—	<b>JTAG Module Serial Data Output</b>
<b>TMS</b>	T9	I	PUC	<b>JTAG Module State Machine Control Input</b>
<b>TRCLK</b>	T8	O	—	<b>Trace Clock for OCDS_L2 Lines</b>
<b>HWCFG0</b>	M14	I	PUC	<b>Hardware Configuration Inputs</b> The Configuration Inputs define the boot options of the TC1115 after a hardware invoked reset operation.
<b>HWCFG1</b>	L14	I	PUC	
<b>HWCFG2</b>	T6	I	PDC	
<b>BRKIN</b>	T5	I	PUC	<b>OCDS Break Input</b> A low level on this pin causes a break in the chip's execution when the OCDS is enabled. In addition, the level of this pin during power-on reset determines the boot configuration.

1) Refers to internal pull-up or pull-down device connected and corresponding type. The notation '—' indicates that the internal pull-up or pull-down device is not enabled.

*Note: P2.12 to P2.15 are always configured as open drain.*

## 3 Functional Description

### 3.1 On-Chip Memories

The TC1115 provides the following on-chip memories:

- Program Memory Interface (PMI) with
  - 32-Kbyte Scratch-pad Code RAM (SPRAM)
  - 16-Kbyte Instruction Cache Memory (ICACHE)
- Data Memory Interface (DMI) with
  - 28-Kbyte Scratch-pad Data RAM (SPRAM)
  - 4-Kbyte Data Cache Memory (DCACHE)
- Data Memory Unit (DMU) with
  - 64-Kbyte SRAM
- 16-Kbyte Boot ROM (BROM)

Advance Information

Functional Description

3.2 Address Map

Table 3-1 defines the specific segment oriented address blocks of the TC1115 with its address range, size, and PMI/DMI access view. Table 3-2 shows the block address map of the Segment 15 which includes on-chip peripheral units and ports.

Table 3-1 TC1115 Block Address Map

### 3.3 Memory Protection System

The TC1115 memory protection system specifies the addressable range and read/write permissions of memory segments available to the currently executing task. The memory protection system controls the position and range of addressable segments in memory. It also controls the types of read and write operations allowed within addressable memory segments. Any illegal memory access is detected by the memory protection hardware, which then invokes the appropriate Trap Service Routine (TSR) to handle the error. Thus, the memory protection system protects critical system functions against both software and hardware errors. The memory protection hardware can also generate signals to the Debug Unit to facilitate tracing illegal memory accesses.

In TC1115, TriCore™ supports two address spaces: the virtual address space and the physical address space. Both address space are 4 Gbytes in size and divided into 16 segments with each segment being 256 Mbytes. The upper 4 bits of the 32-bit address are used to identify the segment. Virtual segments are numbered 0 - 15. But a virtual address is always translated into a physical address before accessing memory. The virtual address is translated into a physical address using one of two translation mechanisms: (a) direct translation, and (b) Page Table Entry (PTE) based translation. If the virtual address belongs to the upper half of the virtual address space then the virtual address is directly used as the physical address (direct translation). If the virtual address belongs to the lower half of the address space, then the virtual address is used directly as the physical address if the processor is operating in physical mode (direct translation) or translated using a Page Table Entry if the processor is operating in virtual mode (PTE translation). These are managed by Memory Management Unit (MMU).

Memory protection is enforced using separate mechanisms for the two translation paths.

#### 3.3.1 Protection for Direct translation

Memory protection for addresses that undergo direct translation is enforced using the range based protection that has been used in the previous generation of the TriCore™ architecture. The range based protection mechanism provides support for protecting memory ranges from unauthorized read, write, or instruction fetch accesses. The TriCore™ architecture provides up to four protection register sets with the PSW.PRS field controlling the selection of the protection register set. Because the TC1115 uses a Harvard-style memory architecture, each Memory Protection Register Set is broken down into a Data Protection Register Set and a Code Protection Register Set. Each Data Protection Register Set can specify up to four address ranges to receive particular protection modes. Each Code Protection Register Set can specify up to two address ranges to receive particular protection modes.

Each of the Data Protection Register Sets and Code Protection Register Sets determines the range and protection modes for a separate memory area. Each contains register pairs which determine the address range (the Data Segment Protection Registers and Code Segment Protection Registers) and one register (Data Protection

---

**Advance Information****Functional Description**

Mode Register) which determines the memory access modes which apply to the specified range.

### 3.3.2 Protection for PTE based translation

Memory protection for addresses that undergo PTE based translation is enforced using the PTE used for the address translation. The PTE provides support for protecting a process from unauthorized read, write, or instruction fetches by other processes. The PTE has the following bits that are provided for the purpose of protection:

- Execute Enable (XE) enables instruction fetch to the page
- Write Enable (WE) enables data writes to the page
- Read Enable (RE) enables data reads from the page

Furthermore, User-0 accesses to virtual addresses in the upper half of the virtual address space are disallowed when operating in virtual mode. In physical mode, User-0 accesses are disallowed only to segments 14 and 15. Any User-0 access to a virtual address that is restricted to User-1 or supervisor mode will cause a Virtual Address Protection (VAP) Trap in both the physical and virtual modes.

### 3.3.3 Memory Checker

The Memory Checker module (MCHK) makes it possible to check the data consistency of memories. It uses DMA moves to read from the selected address area and to write the value read in a memory checker input register (the moves should be 32-bit moves). A polynomial checksum calculation is done with each write operation to the memory checker input register.

### 3.4 On-Chip Bus System

The TC1115 includes two bus systems:

- Local Memory Bus (LMB)
- Flexible Peripheral Interface Bus (FPI)

The LMB-to-FPI (LFI) bridge interconnects the FPI bus and LMB Bus.

#### 3.4.1 Local Memory Bus (LMB)

The Local Memory Bus interconnects the memory units and functional units, such as CPU and DMU. The main objective of the LMB bus is to support devices with fast response time. This allows the DMI and PMI fast access to local memory and reduces load on the FPI bus. The TriCore™ system itself is located on the LMB the bus. Via External Bus Unit, it interconnects TC1115 and external components.

The Local Memory Bus is a synchronous, pipelined, split bus with variable block size transfer support. It supports 8, 16, 32 and 64 bits single beat transactions and variable length 64 bits block transfers.

#### Features:

The LMB provides the following features:

- Synchronous, Pipelined, Multimaster, 64-bit high performance bus
- Optimized for high speed and high performance
- 32-bit address, 64-bit data buses
- Central, simple per cycle arbitration
- Slave controlled wait state insertion
- Address pipelining (max depth - 2)
- Supports Split transactions
- Supports Variable block size transfer
- Supports Locked transaction (read-modify-write)

#### 3.4.2 Flexible Peripheral Interconnect Bus (FPI)

The FPI Bus is an on-chip bus that is used in modular and highly integrated microprocessors and microcontrollers (**systems-on-chips**). FPI Bus is designed for memory mapped data transfers between its bus agents. Bus agents are on-chip function blocks (modules), equipped with an FPI Bus interface and connected via FPI Bus signals. An FPI Bus agent acts as an FPI Bus master when it initiates data read or data write operations once bus ownership has been granted to the agent. An FPI Bus agent that is addressed by an FPI Bus operation acts as an FPI Bus slave when it performs the requested data read or write operation.

---

**Advance Information****Functional Description****Features:**

The FPI Bus is designed with the requirements of high-performance systems in mind. The features are:

- Core independent
- Multimaster capability (up to 16 masters)
- Demultiplexed operation
- Clock synchronous
- Peak transfer rate of up to 800 Mbytes/sec (@ 100 MHz bus clock)
- Address and data bus scalable (address bus up to 32 bits, data bus up to 64 bits)
- 8-/16-/32- and 64-bit data transfers
- Broad range of transfer types from single to multiple data transfers
- Split transaction support for agents with long response time
- Burst transfer capability
- EMI and power consumption minimized

**3.4.3 LFI**

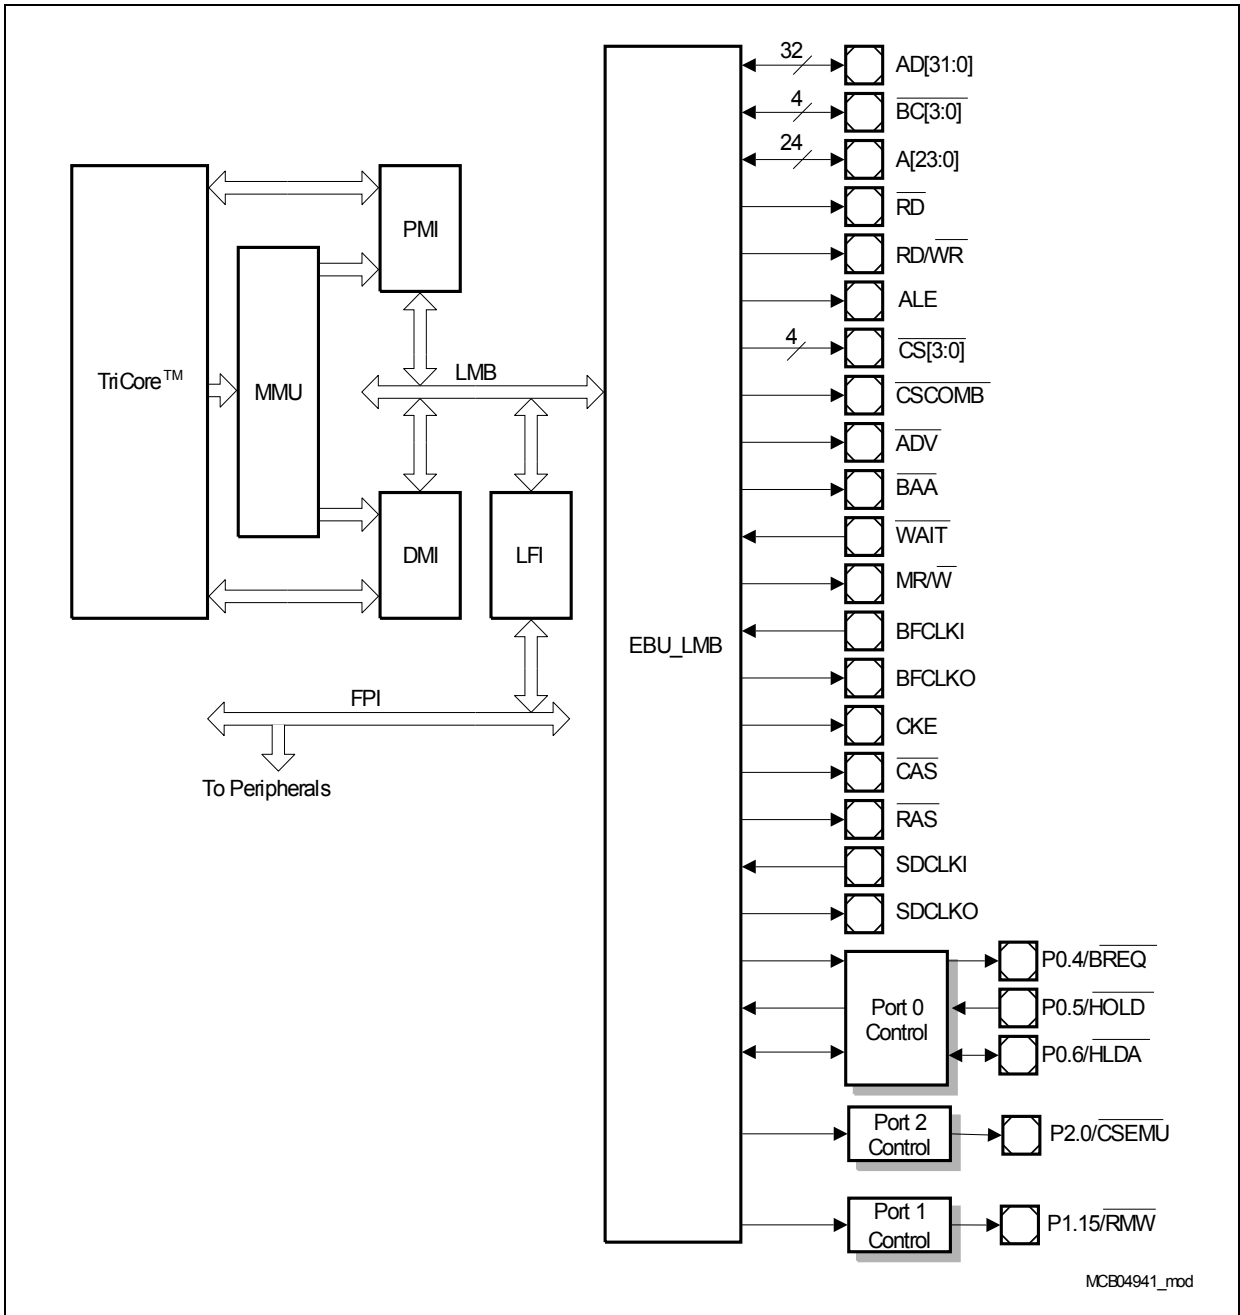

The LMB-to-FPI Interface (LFI) block provides the circuitry to interface (bridge) the FPI bus and the Local Memory Bus (LMB).

**LFI Features:**

- Full support for bus transactions found within current TriCore™ 1.3 based systems:
  - Single 8/16/32-bit Write/Read transfers from FPI to LMB
  - Single 8/16/32/64-bit Write/Read transfers from LMB to FPI
  - Read-Modify-Write transfers of 8/16/32-bit in both directions
  - Burst transactions of 2, 4 or 8 data beats from the FPI to the LMB
  - Burst transactions of 2 or 4 data beats from the LMB to the FPI
- Address decoding and translation as required by TriCore™ 1.3 implementation
- FPI master interface supports full pipelining on FPI bus
- LMB master interface supports pipelining on LMB within the scope of the LMB specification
- FPI master interface can act as default master on FPI bus
- Programmable support for split LMB to FPI read transactions
- Retry generation on both FPI and LMB buses
- Full support for abort, retry, error and FPI timeout conditions
- Flexible LMB/FPI clock ratio support including dynamic clock switching support
- LFI core clock may be shut down when no transactions are being issued to LFI from either bus and the LFI has no transactions in progress, thus saving power.

### 3.5 LMB External Bus Unit

The LMB External Bus Control Unit (EBU) of the TC1115 is the interface between external resources, like memories and peripheral units, and the internal resources connected to on-chip buses if enabled. The basic structure and external interconnections of the EBU are shown in **Figure 3-1**.

**Figure 3-1 EBU Structure and Interface**

**Advance Information**
**Functional Description**

The EBU is used primarily for any Local Memory Bus (LMB) master accessing external memories. The EBU controls all transactions required for this operation and in particular handles the arbitration between the internal EBU master and the external EBU master.

The types of external devices/bus modes controlled by the EBU are:

- Intel-style peripherals (separate  $\overline{RD}$  and  $\overline{WR}$  signals)
- ROMs, EPROMs
- Static RAMs
- PC100 and PC133 SDRAMs (Burst Read/Write Capacity/Multi-Bank/Page support)
- Specific types of Burst Mode Flash devices
- Special support for external emulator/debug hardware

**Features:**

- Supports 64-bit Local Memory Bus (LMB)
- Supports external bus frequency: internal LMB frequency = 1:1 or 1:2
- Provides highly programmable access parameters
- Supports Intel-style peripherals/devices
- Supports PC100 and PC133 (runs in maximum 120 MHz) SDRAM (burst access, multibanking, precharge, refresh)
- Supports 16- and 32-bit SDRAM data bus and 64-, 128-, and 256-Mbit devices
- Supports Burst Flash devices
- Supports Multiplexed access (address and data on the same bus) when PC100 and PC133 SDRAM are not presented on the external bus
- Supports data buffering: Code Prefetch Buffer, Read/Write Buffer
- External master arbitration compatible to C166 and other TriCore™ devices
- Provides 4 programmable address regions (1 dedicated for emulator)
- Provides a C<sub>S</sub>GLB signal, bit programmable to combine one or more  $\overline{CS}$  lines for buffer control
- Provides RMW signal reflecting read-modify-write action
- Supports Little Endian byte ordering
- Provides signal for controlling data flow of slow-memory buffer

### 3.6 Direct Memory Access (DMA)

The Direct Memory Access Controller executes DMA transactions from a source address location to a destination address location, without intervention of the CPU. One DMA transaction is controlled by one DMA channel. Each DMA channel has assigned its own channel register set. The total of 8 channels are provided by one DMA sub-block.

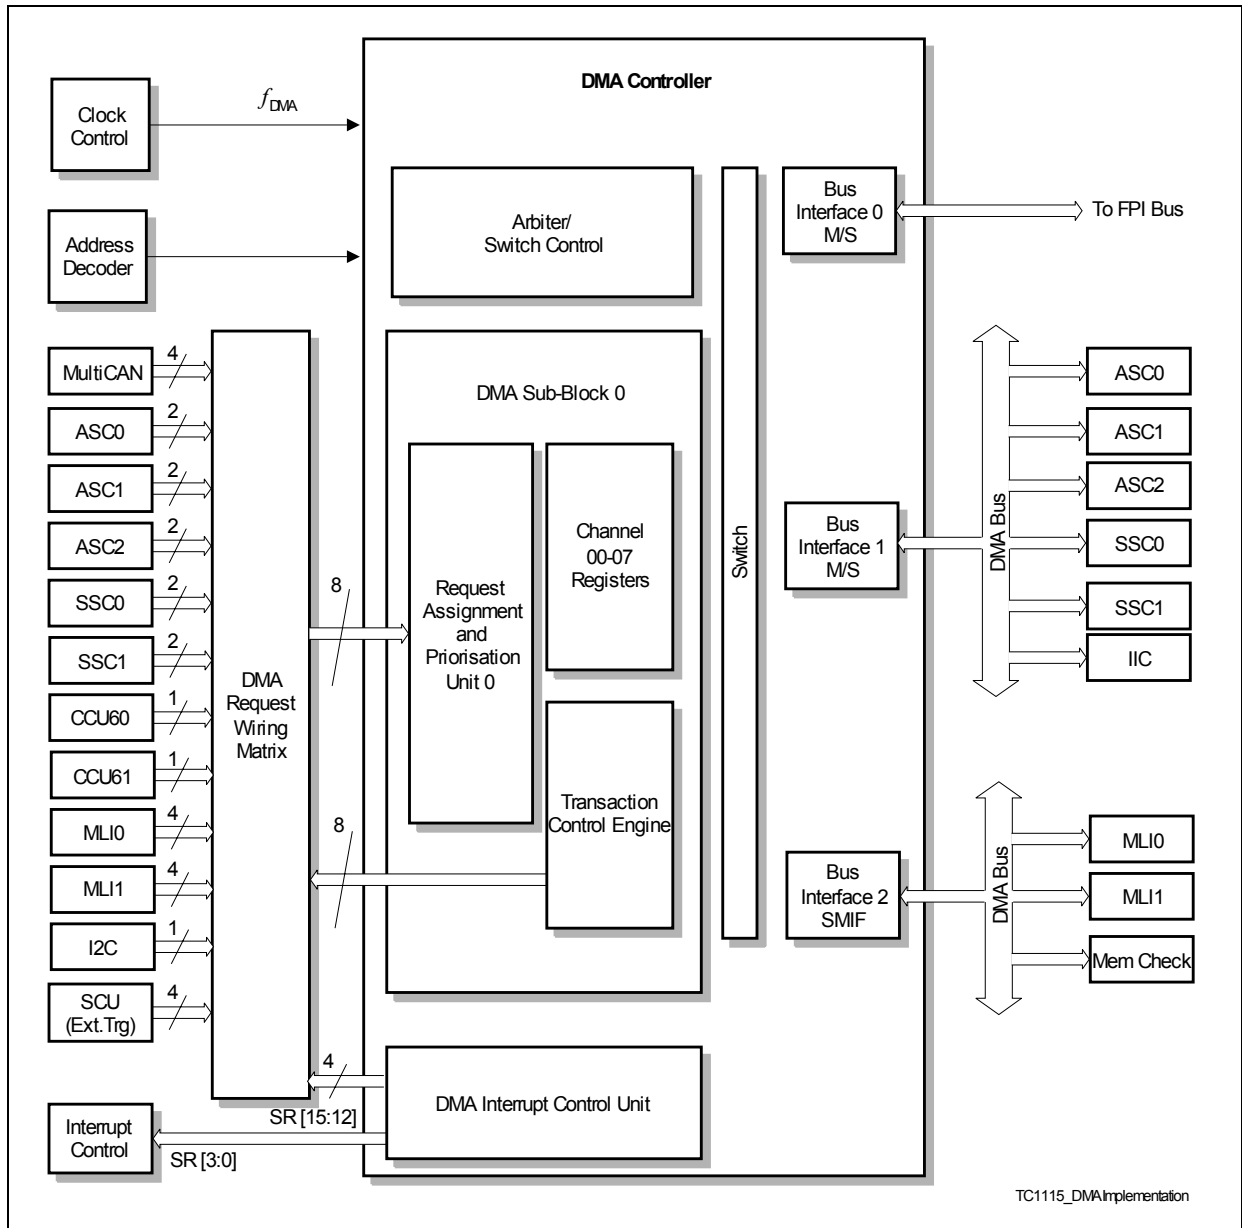

The DMA module is connected to 3 bus interfaces in TC1115, the Flexible Peripheral Interconnect Bus (FPI), the DMA Bus and the Micro Link Bus. It can do transfers on each of the buses as well as between the buses.

In addition, it bridges accesses from the Flexible Peripheral Interconnect Bus to the peripherals on the DMA Bus, allowing easy access to these peripherals by CPU. Clock control, address decoding, DMA request wiring, and DMA interrupt service request control are implementation specific and managed outside the DMA controller kernel.

#### Features:

- 8 independent DMA channels
  - Up to 8 selectable request inputs per DMA channel
  - Programmable priority of DMA channels within a DMA sub-block (2 levels)
  - Software and hardware DMA request generation
  - Hardware requests by selected peripherals and external inputs
- Programmable priority of the DMA sub-block on the bus interfaces
- Buffer capability for move actions on the buses (min. 1 move per bus is buffered).
- Individually programmable operation modes for each DMA channel
  - Single mode: stops and disables DMA channel after a predefined number of DMA transfers
  - Continuous mode: DMA channel remains enabled after a predefined number of DMA transfers; DMA transaction can be repeated.
  - Programmable address modification
- Full 32-bit addressing capability of each DMA channel
  - 4-Gbyte address range
  - Support of circular buffer addressing mode
- Programmable data width of a DMA transaction: 8-bit, 16-bit, or 32-bit
- Micro Link supported
- Register set for each DMA channel
  - Source and destination address register
  - Channel control and status register
  - Transfer count register
- Flexible interrupt generation (the service request node logic for the MLI channels is also implemented in the DMA module)
- All buses/interfaces connected to the DMA module must work at the same frequency.
- Read/write requests of the FPI Bus Side to the Remote Peripherals are bridged to the DMA Bus (only the DMA is master on the DMA bus)

The basic structure and external interconnections of the DMA are shown in **Figure 3-2**.

**Figure 3-2 DMA Controller Structure and Interconnections**

### 3.7 Interrupt System

An interrupt request can be serviced by the CPU, which is called “Service Provider”. Interrupt requests are referred to as “Service Requests” in this document.

Each peripheral in the TC1115 can generate service requests. Additionally, the Bus Control Unit, the Debug Unit, the DMA Controller and even the CPU itself can generate service requests to the Service Provider. As shown in [Figure 3-3](#), each unit that can generate service requests is connected to one or multiple Service Request Nodes (SRN). Each SRN contains a Service Request Control Register mod\_SRC, where “mod” is the identifier of the unit requesting service. The SRNs are connected to the Interrupt Control Unit (ICU) via the CPU Interrupt Arbitration Bus. The ICU arbitrates service requests for the CPU and administers the Interrupt Arbitration Bus.

Units that can generate service requests are:

- Asynchronous/Synchronous Serial Interfaces (ASC0, ASC1 and ASC2) with 4 SRNs each
- High-Speed Synchronous Serial Interfaces (SSC0 and SSC1) with 3 SRNs each
- Inter IC Interface (IIC) with 3 SRNs
- Micro Link Interface MLI0 with 4 SRNs and MLI1 with 2 SRNs
- General Purpose Timer Unit (GPTU) with 8 SRNs
- Capture/Compare Unit (CCU60 and CCU61) with 4 SRNs each
- MultiCAN (CAN) with 16 SRNs
- External Interrupts with 4 SRNs
- Direct Memory Access Controller (DMA) with 4 SRNs
- DMA Bus with 1 SRN
- System Timer (STM) with 2 SRNs
- Bus Control Units (SBCU and LBCU) with 1 SRN each
- Central Processing Unit (CPU) with 4 SRNs
- Floating Point Unit (FPU) with 1 SRN
- Debug Unit (OCDS) with 1 SRN

The CPU can make service requests directly to itself (via the ICU). The CPU Service Request Nodes are activated through software.

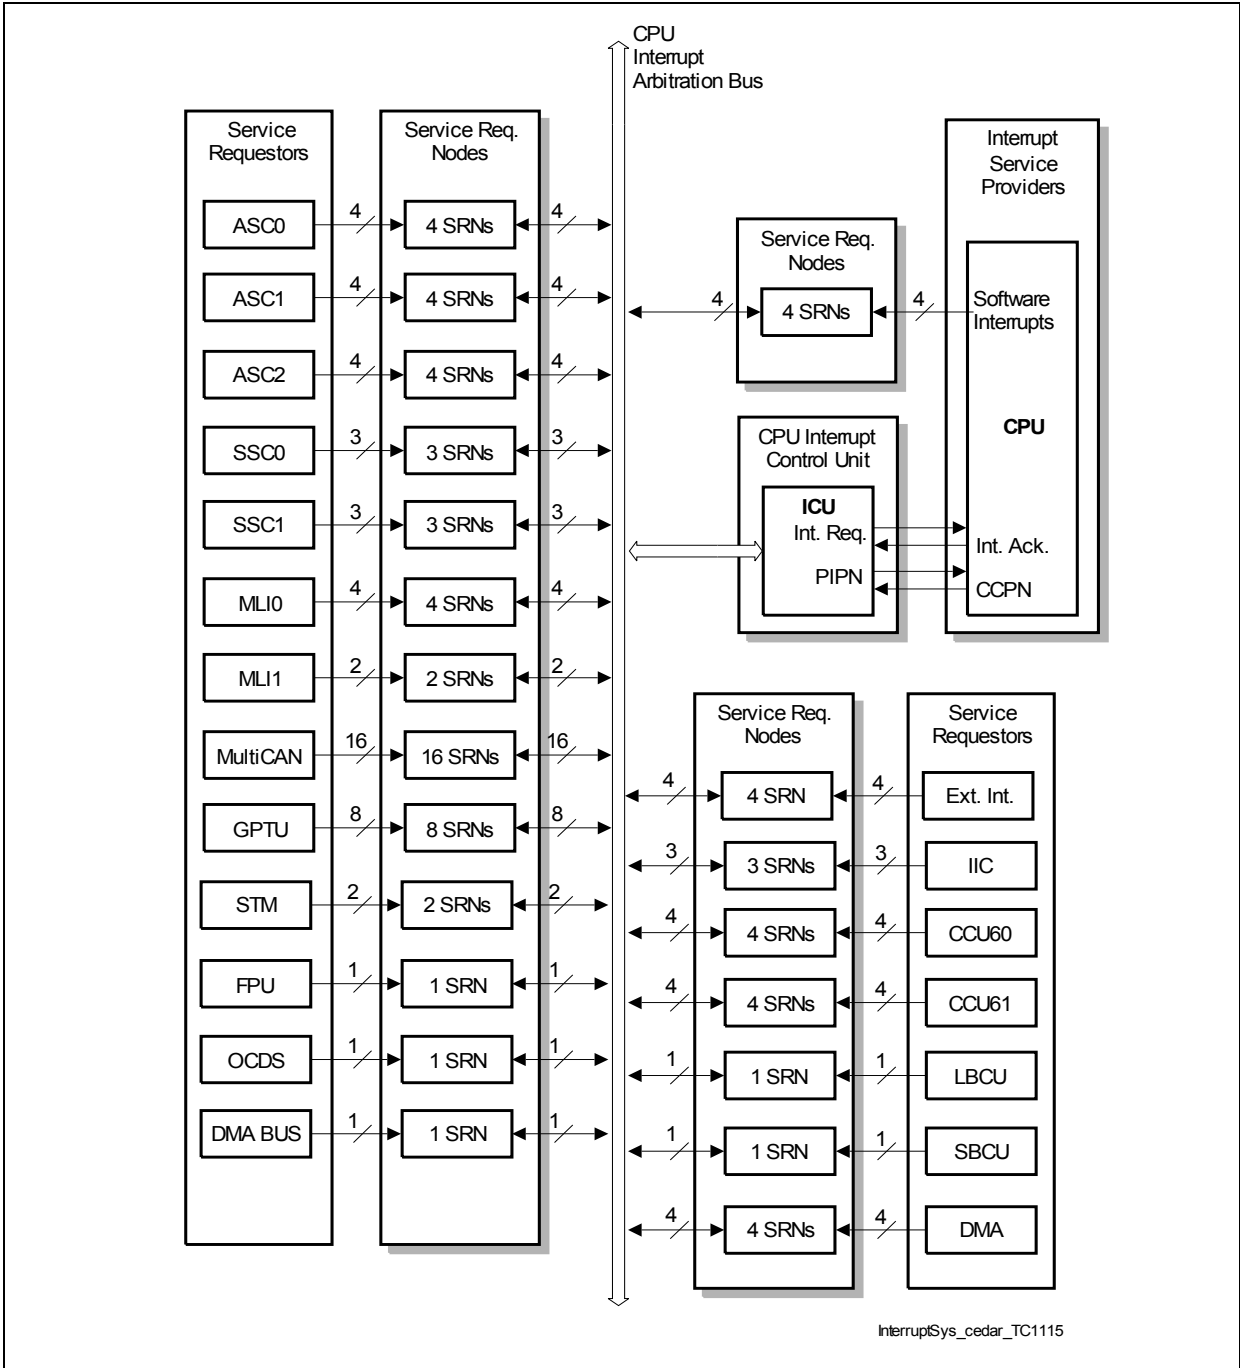

Figure 3-3 Block Diagram of the TC1115 Interrupt System

### 3.8 Parallel Ports

The TC1115 has 72 digital input/output port lines, which are organized into four parallel 16-bit ports and one parallel 8-bit port, Port P0 to Port P4 with 3.3 V nominal voltage.

The digital parallel ports can be used as general purpose I/O lines or they can perform input/output functions for the on-chip peripheral units. An overview on the port-to-peripheral unit assignment is shown in **Figure 3-4**.

**Figure 3-4 Parallel Ports of the TC1115**

### 3.9 Asynchronous/Synchronous Serial Interface (ASC)

**Figure 3-5** shows a global view of the functional blocks of three Asynchronous/Synchronous Serial interfaces (ASC0, ASC1 and ASC2).

Each ASC module (ASC0/ASC1/ASC2) communicates with the external world via one pair of I/O lines. The RXD line is the receive data input signal (in synchronous mode also output). TXD is the transmit output signal. Clock control, address decoding, and interrupt service request control are managed outside the ASC module kernel.

The Asynchronous/Synchronous Serial interfaces provide serial communication between the TC1115 and other microcontrollers, microprocessors or external peripherals.

Each ASC supports full-duplex asynchronous communication and half-duplex synchronous communication. In synchronous mode, data is transmitted or received synchronous to a shift clock which is generated by the ASC internally. In asynchronous mode, 8-bit or 9-bit data transfer, parity generation, and the number of stop bits can be selected. Parity, framing, and overrun error detection are provided to increase the reliability of data transfers. Transmission and reception of data is double-buffered. For multiprocessor communication, a mechanism is included to distinguish address bytes from data bytes. Testing is supported by a loop-back option. A 13-bit baud-rate generator provides the ASC with a separate serial clock signal that can be accurately adjusted by a prescaler implemented as a fractional divider.

Figure 3-5 General Block Diagram of the ASC Interfaces

---

**Advance Information****Functional Description****Features:**

- Full-duplex asynchronous operating modes
  - 8-bit or 9-bit data frames, LSB first
  - Parity bit generation/checking
  - One or two stop bits
  - Baud rate from 4.6875 MBaud to 1.1 Baud (@ 75 MHz clock)
- Multiprocessor mode for automatic address/data byte detection
- Loop-back capability
- Half-duplex 8-bit synchronous operating mode
  - Baud rate from 9.375 MBaud to 762.9 Baud (@ 75 MHz clock)
- Support for IrDA data transmission up to 115.2 kBaud maximum
- Double buffered transmitter/receiver
- Interrupt generation
  - On a transmitter buffer empty condition
  - On a transmit last bit of a frame condition
  - On a receiver buffer full condition
  - On an error condition (frame, parity, overrun error)
- FIFO
  - 8-byte receive FIFO (RXFIFO)
  - 8-byte transmit FIFO (TXFIFO)
  - Independent control of RXFIFO and TXFIFO
  - 9-bit FIFO data width
  - Programmable Receive/Transmit Interrupt Trigger Level
  - Receive and Transmit FIFO filling level indication
  - Overrun error generation
  - Underflow error generation

### 3.10 High-Speed Synchronous Serial Interface (SSC)

**Figure 3-6** shows a global view of the functional blocks of two High-Speed Synchronous Serial interfaces (SSC0 and SSC1).

Each SSC supports full-duplex and half-duplex serial synchronous communication up to 37.5 MBaud (@ 75 MHz module clock) with receive and transmit FIFO support. The serial clock signal can be generated by the SSC itself (master mode) or can be received from an external master (slave mode). Data width, shift direction, clock polarity and phase are programmable. This allows communication with SPI-compatible devices. Transmission and reception of data is double-buffered. A shift clock generator provides the SSC with a separate serial clock signal. Eight slave select inputs are available for slave mode operation. Eight programmable slave select outputs (chip selects) are supported in master mode.

#### Features:

- Master and slave mode operation
  - Full-duplex or half-duplex operation
  - Automatic pad control possible
- Flexible data format
  - Programmable number of data bits: 2 to 16 bits
  - Programmable shift direction: LSB or MSB shift first
  - Programmable clock polarity: idle low or high state for the shift clock
  - Programmable clock/data phase: data shift with leading or trailing edge of the shift clock
- Baud rate generation minimum at 572.2 Baud (@ 75 MHz module clock)
- Interrupt generation
  - On a transmitter empty condition
  - On a receiver full condition
  - On an error condition (receive, phase, baud rate, transmit error)
- Four-pin interface
- Flexible SSC pin configuration
- Up to eight slave select inputs in slave mode
- Up to eight programmable slave select outputs SLSO in master mode
  - Automatic SLSO generation with programmable timing
  - Programmable active level and enable control
- 4-stage receive FIFO (RXFIFO) and 4-stage transmit FIFO (TXFIFO)
  - Independent control of RXFIFO and TXFIFO
  - 2- to 16-bit FIFO data width
  - Programmable receive/transmit interrupt trigger level
  - Receive and transmit FIFO filling level indication
  - Overrun error generation
  - Underflow error generation

Figure 3-6 General Block Diagram of the SSC Interfaces

### 3.11 Inter IC Serial Interface (IIC)

**Figure 3-7** shows a global view of the functional blocks of the Inter IC Serial Interface (IIC).

The IIC module has four I/O lines, located at Port 2. The IIC module is further supplied with clock control, interrupt control and address decoding logic. One DMA request can be generated by IIC module.

**Figure 3-7 General Block Diagram of the IIC Interface**

The on-chip IIC bus module connects the platform buses to other external controllers and/or peripherals via the two-line serial IIC interface. One line is responsible for clock transfer and synchronization (SCL), the other is responsible for the data transfer (SDA). The IIC bus module provides communication at data rates of up to 400 kbit/sec and features 7-bit addressing as well as 10-bit addressing. This module is fully compatible to the IIC bus protocol.

The module can operate in three different modes:

**Master mode**, where the IIC controls the bus transactions and provides the clock signal.

**Slave mode**, where an external master controls the bus transactions and provides the clock signal.

**Multimaster mode**, where several masters can be connected to the bus, i.e. the IIC can be master or slave.

The on-chip IIC bus module allows efficient communication via the common IIC bus. The module unloads the CPU of low level tasks such as:

- (De)Serialization of bus data
- Generation of start and stop conditions
- Monitoring the bus lines in slave mode

---

**Advance Information****Functional Description**

- Evaluation of the device address in slave mode
- Bus access arbitration in multimaster mode

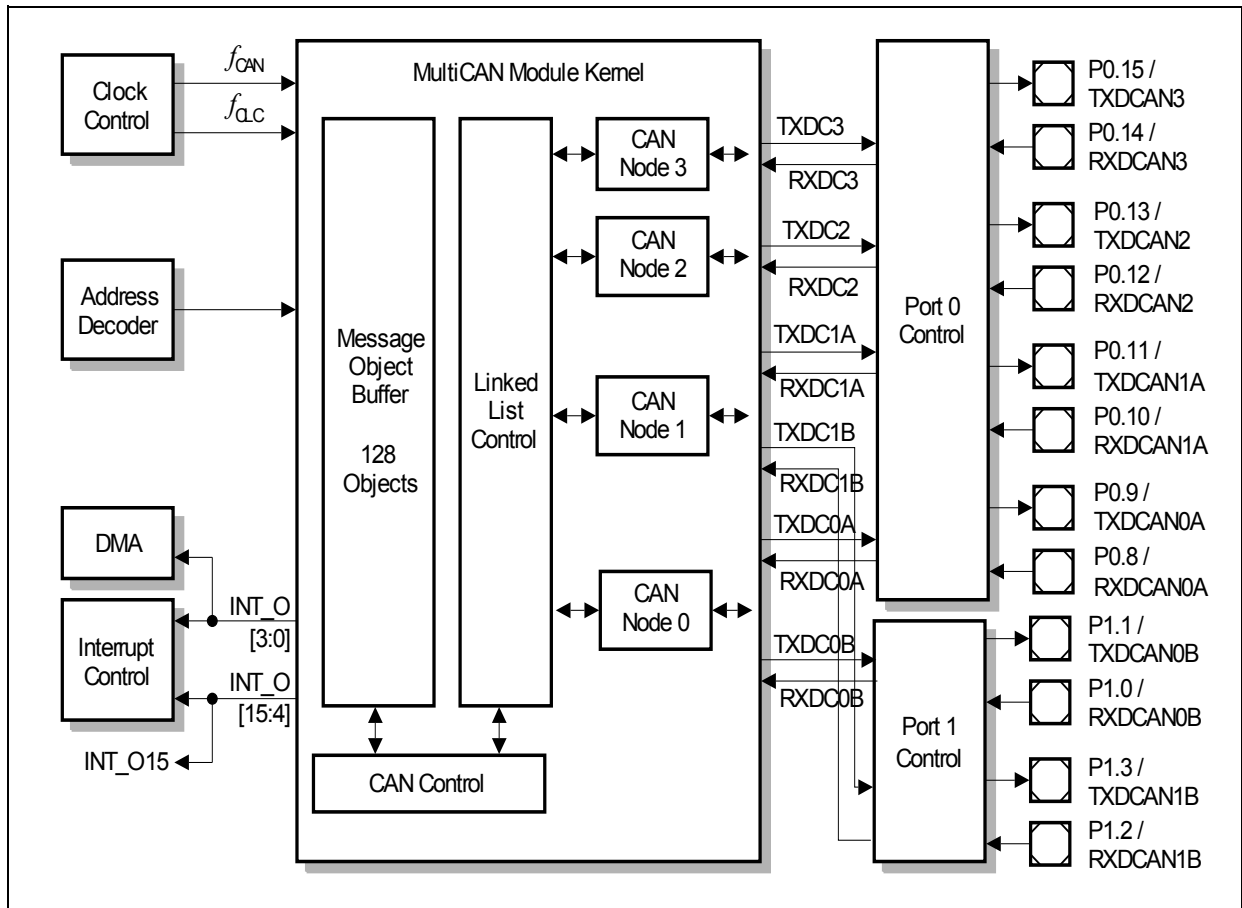

**Features:**

- Extended buffer allows up to 4 send/receive data bytes to be stored
- Selectable baud rate generation
- Support of standard 100 kBaud and extended 400 kBaud data rates
- Operation in 7-bit addressing mode or 10-bit addressing mode
- Flexible control via interrupt service routines or by polling
- Dynamic access to up to 2 physical IIC buses

### 3.12 MultiCAN

Figure 3-8 shows a global view of the functional blocks of the MultiCAN module.

**Figure 3-8 General Block Diagram of the MultiCAN Interface**

The MultiCAN module contains 4 Full-CAN nodes operating independently or exchanging data and remote frames via a gateway function. Transmission and reception of CAN frames is handled in accordance to CAN specification V2.0 B (active). Each CAN node can receive and transmit standard frames with 11-bit identifiers as well as extended frames with 29-bit identifiers.

All CAN nodes share a common set of message objects, where each message object may be individually allocated to one of the CAN nodes. Besides serving as a storage container for incoming and outgoing frames, message objects may be combined to build gateways between the CAN nodes or to setup a FIFO buffer.

The message objects are organized in double chained lists, where each CAN node has its own list of message objects. A CAN node stores frames only into message objects that are allocated to the list of the CAN node. It only transmits messages from objects of this list.

A powerful, command driven list controller performs all list operations.

**Advance Information****Functional Description**

The bit timings for the CAN nodes are derived from the peripheral clock ( $f_{CAN}$ ) and are programmable up to a data rate of 1 MBaud. A pair of receive and transmit pins connects each CAN node to a bus transceiver.

**Features:**

- Compliant to ISO 11898
- CAN functionality according to CAN specification V2.0 B (active)
- Dedicated control registers are provided for each CAN node
- A data transfer rate up to 1 MBaud is supported
- Flexible and powerful message transfer control and error handling capabilities are implemented
- Advanced CAN bus bit timing analysis and baud rate detection can be performed for each CAN node via the frame counter
- Full-CAN functionality: A set of 128 message objects can be individually
  - allocated (assigned) to any CAN node
  - configured as transmit or receive object
  - setup to handle frames with 11-bit or 29-bit identifier
  - counted or assigned a timestamp via a frame counter
  - configured to remote monitoring mode
- Advanced Acceptance Filtering:
  - Each message object provides an individual acceptance mask to filter incoming frames.
  - A message object can be configured to accept only standard or only extended frames or to accept both standard and extended frames.
  - Message objects can be grouped into 4 priority classes.
  - The selection of the message to be transmitted first can be performed on the basis of frame identifier, IDE bit and RTR bit according to CAN arbitration rules.
- Advanced Message Object Functionality:
  - Message objects can be combined to build FIFO message buffers of arbitrary size, which is only limited by the total number of message objects.
  - Message objects can be linked to form a gateway to automatically transfer frames between two different CAN buses. A single gateway can link any two CAN nodes. An arbitrary number of gateways may be defined.
- Advanced Data Management:
  - The Message objects are organized in double chained lists.
  - List reorganizations may be performed at any time, even during full operation of the CAN nodes.
  - A powerful, command driven list controller manages the organization of the list structure and ensures consistency of the list.
  - Message FIFOs are based on the list structure and can easily be scaled in size during CAN operation.

---

**Advance Information****Functional Description**

- Static Allocation Commands offer compatibility with TwinCAN applications, which are not list based.
- Advanced Interrupt Handling:
  - Up to 16 interrupt output lines are available. Most interrupt requests can be individually routed to one of the 16 interrupt output lines.
  - Message postprocessing notifications can be flexibly aggregated into a dedicated register field of 256 notification bits.

### 3.13 Micro Link Serial Bus Interface (MLI)

Figure 3-9 shows a global view of the functional blocks of two Micro Link Serial Bus Interfaces (MLI0 and MLI1).

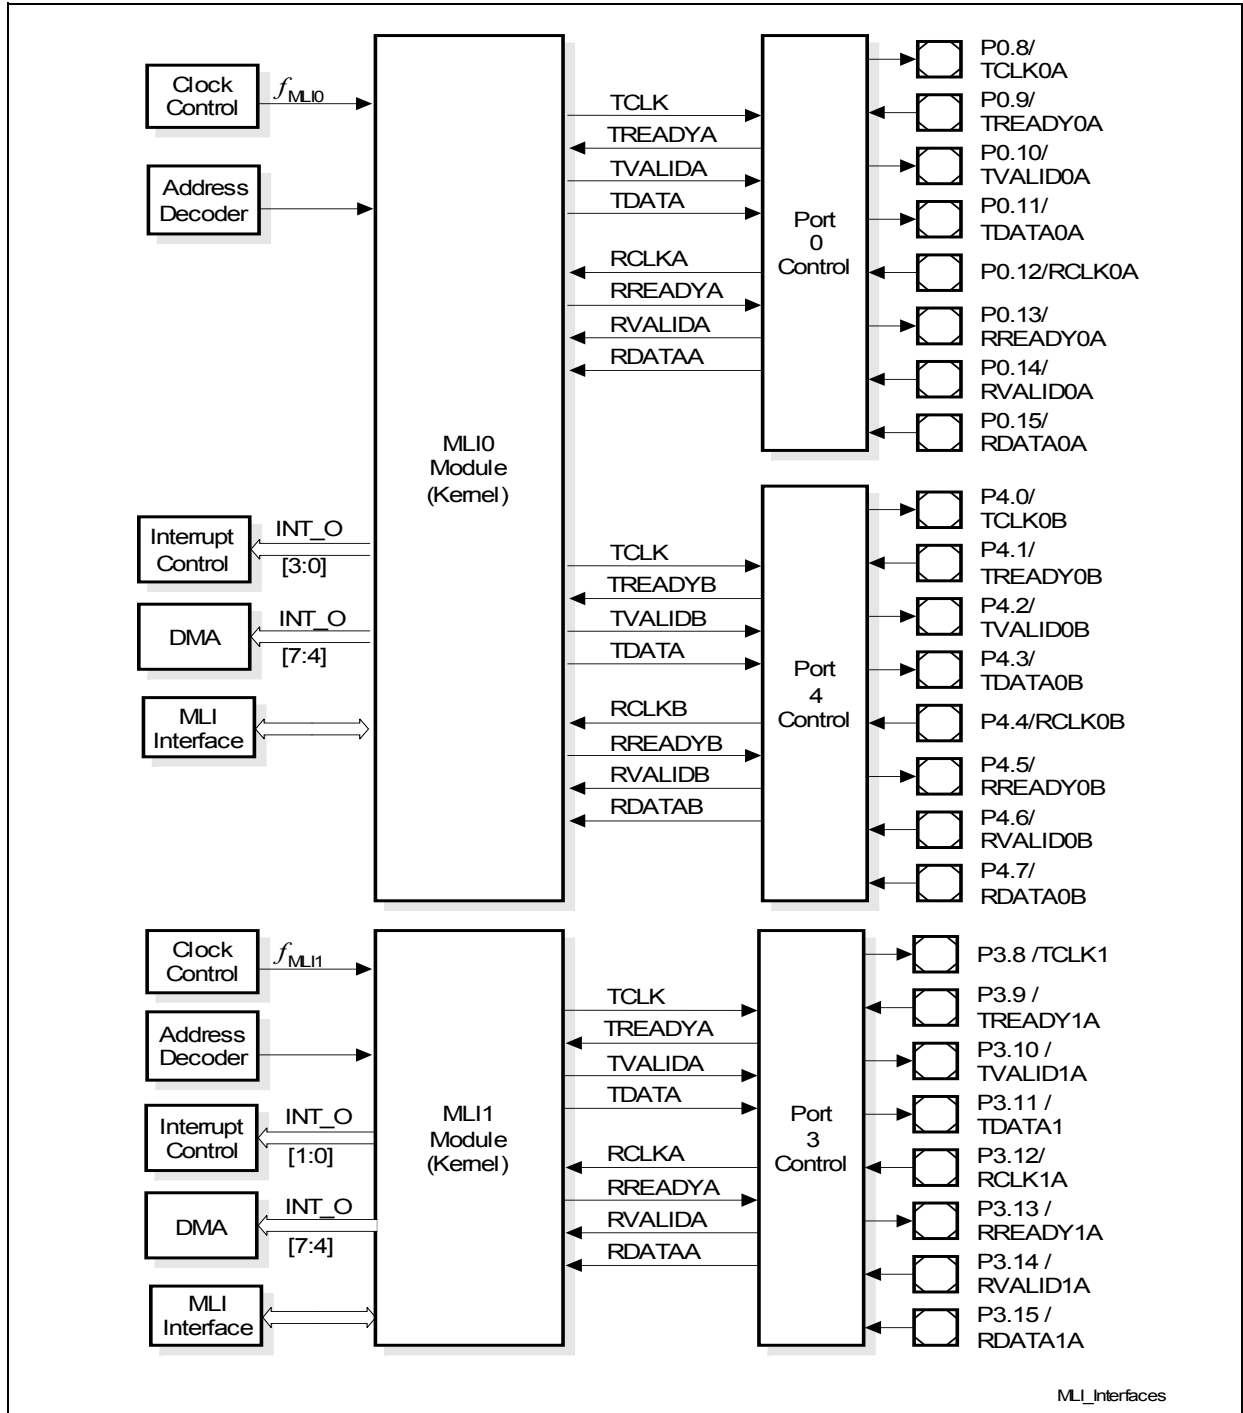

Figure 3-9 General Block Diagram of the MLI0 and MLI1 Interfaces

---

**Advance Information****Functional Description**

The Micro Link Serial Bus Interface is dedicated to the serial communication between the other Infineon 32-bit controllers with MLI. The communication is intended to be fast due to an address translation system, and it is not necessary to have any special program in the second controller.

**Features:**

- Serial communication from the MLI transmitter to MLI receiver of another controller
- Module supports connection of each MLI with up to four MLI from other controllers
- Fully transparent read/write access supported (= remote programming)
- Complete address range of target controller available
- Special protocol to transfer data, address offset, or address offset and data
- Error control using a parity bit
- 32-bit, 16-bit, and 8-bit data transfers
- Address offset width: from 1- to 16-bit
- Baud rate:  $f_{MLI} / 2$  (symmetric shift clock approach),  
baud rate definition by the corresponding fractional divider

### 3.14 General Purpose Timer Unit (GPTU)

Figure 3-10 shows a global view of the functional blocks of the General Purpose Timer Unit (GPTU).

**Figure 3-10 General Block Diagram of the GPTU Interface**

The GPTU consists of three 32-bit timers designed to solve such application tasks as event timing, event counting, and event recording. The GPTU communicates with the external world via eight I/O lines located at Port 0.

The three timers of GPTU module, T0, T1 and T2, can operate independently of each other or can be combined:

**General Features:**

- All timers are 32-bit precision timers with a maximum input frequency of  $f_{GPTU}$
- Events generated in T0 or T1 can be used to trigger actions in T2
- Timer overflow or underflow in T2 can be used to clock either T0 or T1
- T0 and T1 can be concatenated to form one 64-bit timer

**Features of T0 and T1:**

- Each timer has a dedicated 32-bit reload register with automatic reload on overflow
- Timers can be split into individual 8-, 16-, or 24-bit timers with individual reload registers

**Advance Information****Functional Description**

- Overflow signals can be selected to generate service requests, pin output signals, and T2 trigger events
- Two input pins can define a count option

**Features of T2:**

- Count up or down is selectable
- Operating modes:
  - Timer
  - Counter
  - Quadrature counter (incremental/phase encoded counter interface)
- Options:
  - External start/stop, one-shot operation, timer clear on external event
  - Count direction control through software or an external event
  - Two 32-bit reload/capture registers
- Reload modes:
  - Reload on overflow or underflow
  - Reload on external event: positive transition, negative transition, or both transitions
- Capture modes:
  - Capture on external event: positive transition, negative transition, or both transitions
  - Capture and clear timer on external event: positive transition, negative transition, or both transitions
- Can be split into two 16-bit counter/timers
- Timer count, reload, capture, and trigger functions can be assigned to input pins. T0 and T1 overflow events can also be assigned to these functions.
- Overflow and underflow signals can be used to trigger T0 and/or T1 and to toggle output pins
- T2 events are freely assignable to the service request nodes.

### 3.15 Capture/Compare Unit 6 (CCU6)

**Figure 3-11** shows a global view of the functional blocks of two Capture/Compare Units (CCU60 and CCU61).

Both of the CCU6 modules are further supplied by clock control, interrupt control, address decoding, and port control logic. One DMA request can be generated by each CCU6 module.

Each CCU6 provides two independent timers (T12, T13), which can be used for PWM generation, especially for AC-motor control. Additionally, special control modes for block commutation and multi-phase machines are supported.

#### Timer 12 Features:

- Three capture/compare channels, each channel can be used either as capture or as compare channel.
- Generation of a three-phase PWM supported (six outputs, individual signals for highside and lowside switches)
- 16-bit resolution, maximum count frequency = peripheral clock
- Dead-time control for each channel to avoid short-circuits in the power stage
- Concurrent update of the required T12/13 registers
- Center-aligned and edge-aligned PWM can be generated
- Single-shot mode supported
- Many interrupt request sources
- Hysteresis-like control mode

#### Timer 13 Features:

- One independent compare channel with one output
- 16-bit resolution, maximum count frequency = peripheral clock
- Can be synchronized to T12
- Interrupt generation at period-match and compare-match
- Single-shot mode supported

#### Additional Features:

- Block commutation for Brushless DC-drives implemented
- Position detection via Hall-sensor pattern
- Automatic rotational speed measurement for block commutation
- Integrated error handling
- Fast emergency stop without CPU load via external signal ( $\overline{\text{CTRAP}}$ )
- Control modes for multi-channel AC-drives
- Output levels can be selected and adapted to the power stage

Advance Information

Functional Description

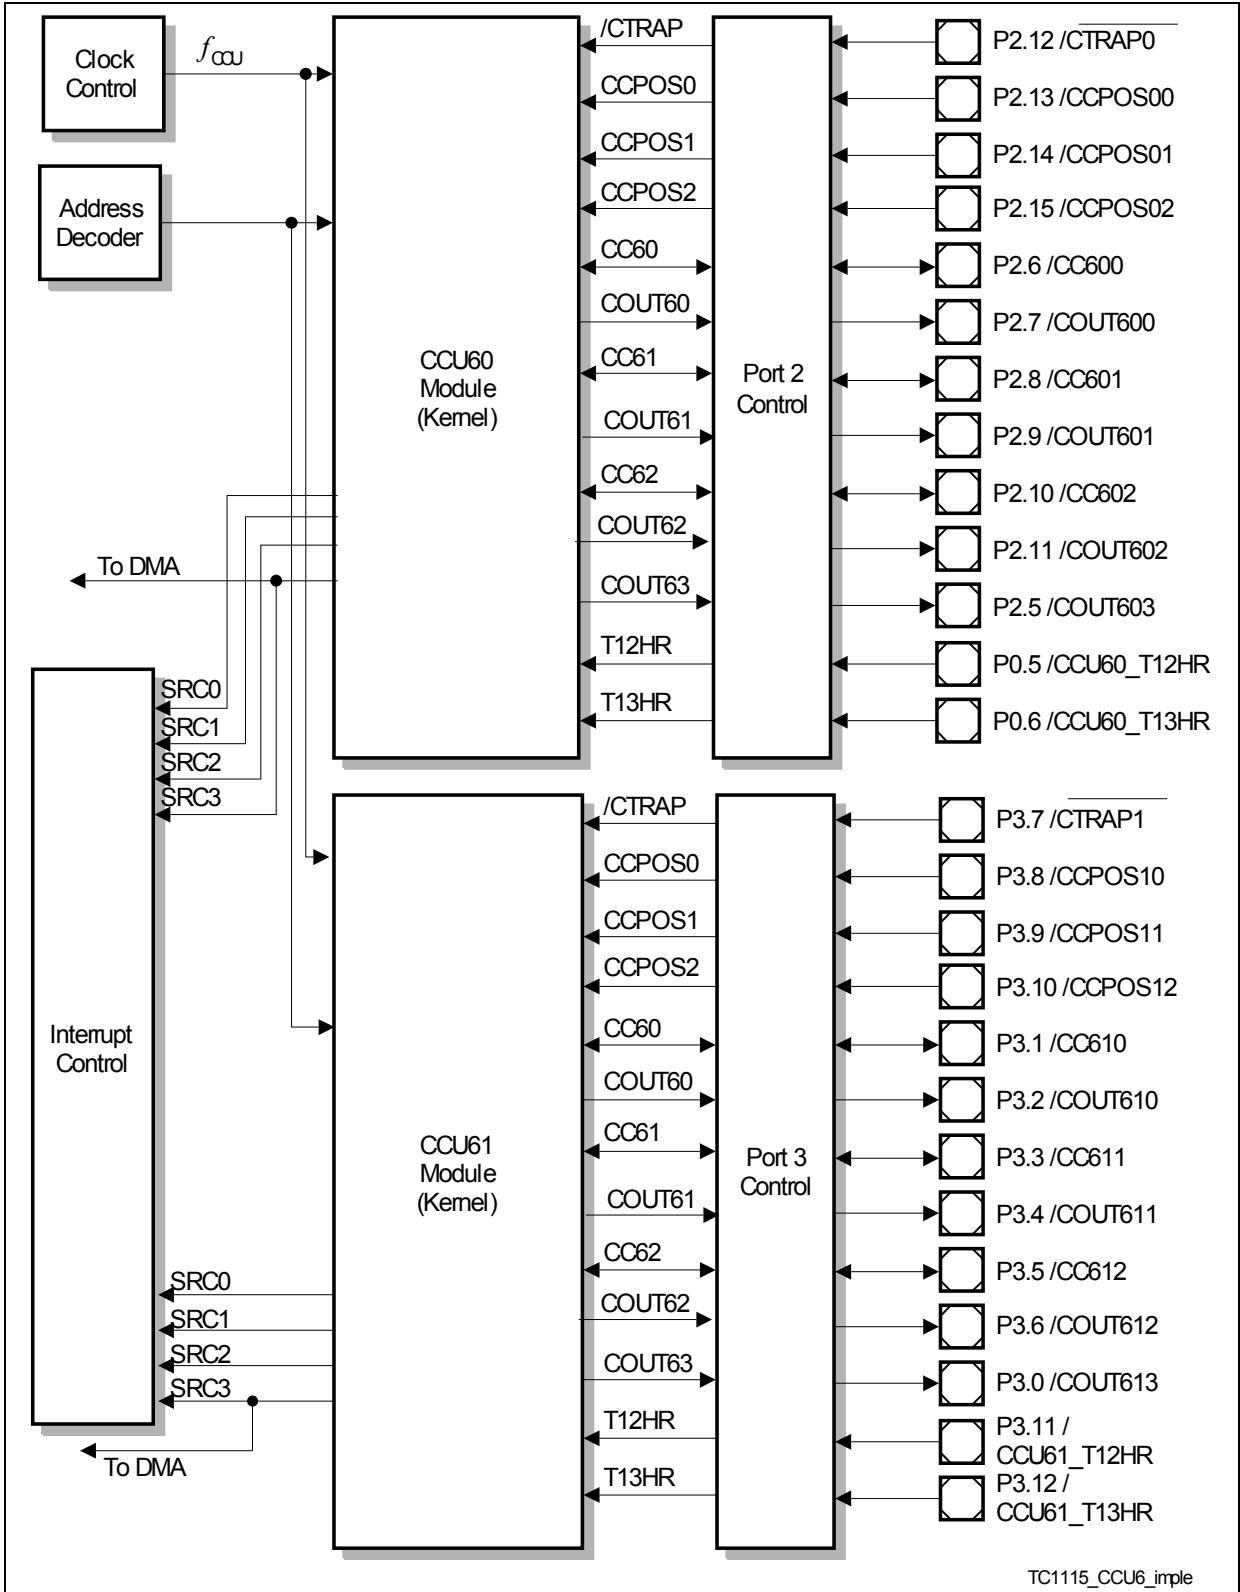

Figure 3-11 General Block Diagram of the CCU6 Interfaces

### 3.16 System Timer

The STM within the TC1115 is designed for global system timing applications requiring both high precision and long range. The STM provides the following features:

- Free-running 56-bit counter
- All 56 bits can be read synchronously
- Different 32-bit portions of the 56-bit counter can be read synchronously
- Flexible interrupt generation on partial STM content compare match
- Driven by clock  $f_{\text{STM}}$  after reset (default after reset is  $f_{\text{STM}} = f_{\text{SYS}} = 150 \text{ MHz}$ )
- Counting starts automatically after a reset operation
- STM is reset under following reset causes:
  - Wake-up reset (PMG\_CON.DSRW must be set)
  - Software reset (RST\_REQ.RRSTM must be set)
  - Power-on reset
- STM (and the clock divider) is not reset at watchdog reset and hardware reset ( $\overline{\text{HDRST}} = 0$ )

The STM is an upward counter, running with the system clock frequency  $f_{\text{SYS}}$  (after reset  $f_{\text{STM}} = f_{\text{SYS}}$ ). It is enabled per default after reset, and immediately starts counting up. Other than via reset, it is not possible to affect the contents of the timer during normal operation of the application; it can only be read, but not written to. Depending on the implementation of the clock control of the STM, the timer can optionally be disabled or suspended for power-saving and debugging purposes via a clock control register.

The maximum clock period is  $2^{56}/f_{\text{STM}}$ . At  $f_{\text{STM}} = 150 \text{ MHz}$  (maximum), for example, the STM counts 15.2 years before overflowing. Thus, it is capable of continuously timing the entire expected product lifetime of a system without overflowing.

Figure 3-12 Block Diagram of the STM Module

### 3.17 Watchdog Timer

The Watchdog Timer (WDT) provides a highly reliable and secure way to detect and recover from software or hardware failure. The WDT helps to abort an accidental malfunction of the TC1115 in a user-specified time period. When enabled, the WDT will cause the TC1115 system to be reset if the WDT is not serviced within a user-programmable time period. The CPU must service the WDT within this time interval to prevent the WDT from causing a TC1115 system reset. Hence, routine service of the WDT confirms that the system is functioning properly.

In addition to this standard “Watchdog” function, the WDT incorporates the ENDINIT feature and monitors its modifications. A system-wide line is connected to the ENDINIT bit implemented in a WDT control register, serving as an additional write-protection for critical registers (besides supervisor mode protection). Registers protected via this line can be modified only when supervisor mode is active and bit ENDINIT = 0.

A further enhancement in the TC1115’s Watchdog Timer is its reset prewarning operation. Instead of immediately resetting the device upon detection of an error, the WDT first issues a Non-Maskable Interrupt (NMI) to the CPU before finally resetting the device at a specified time period later. This gives the CPU a chance to save system state to memory for later examination of the cause of the malfunction, thus providing an important aid in debugging.

#### Features:

- 16-bit Watchdog counter
- Selectable input frequency:  $f_{SYS}/256$  or  $f_{SYS}/16384$
- 16-bit user-definable reload value for normal Watchdog operation, fixed reload value for time-out and prewarning modes
- Incorporation of the ENDINIT bit and monitoring of its modifications
- Sophisticated password access mechanism with fixed and user-definable password fields
- Proper access always requires two write accesses. The time between the two accesses is monitored by the WDT.
- Access Error Detection: Invalid password (during first access) or invalid guard bits (during second access) trigger the Watchdog reset generation.
- Overflow Error Detection: An overflow of the counter triggers the Watchdog reset generation.
- Watchdog function can be disabled; access protection and ENDINIT monitor function remain enabled.
- Double Reset Detection: If a Watchdog induced reset occurs twice without a proper access to its control register in between, a severe system malfunction is assumed and the TC1115 is held in reset until a power-on reset. This prevents the device from being periodically reset if, for instance, connection to the external memory has been lost such that even system initialization could not be performed.

---

**Advance Information****Functional Description**

- Important debugging support is provided through the reset prewarning operation by first issuing an NMI to the CPU before finally resetting the device after a certain period of time.

### 3.18 System Control Unit

The System Control Unit (SCU) of the TC1115 handles the system control tasks. All of these system functions are tightly coupled; thus, they are conveniently handled by one unit, the SCU. The system tasks of the SCU are:

- Clock Control
  - Clock generation
  - Oscillator and PLL control
- Reset and Boot Control
  - Generation of all internal reset signals
  - Generation of external hardware and software reset signal
- Power Management Control
  - Enabling of several power management modes
- Configuration input sampling
- FPU interrupts
- External Request Unit
- Parity Error Control
- Fault SRAM Fuse Box
- CSCOMB Control
- EBU Pull-Up Control
- NMI Control and Status
- DMA Request Signal Selection

### 3.19 Boot Options

The TC1115 booting schemes provides a number of different boot options for the start of code execution. **Table 3-3** shows the boot options available in the TC1115.

**Table 3-3 Boot Selections**

<b>BRKIN<sup>1)</sup></b>	<b>TM<sup>1)</sup></b>	<b>HWCFG [2:0]</b>	<b>Type of Boot</b>	<b>PC Start Value (User Entry)</b>		
1	1	000	<b>Bootstrap Loader</b> Serial boot from ASC to PMI scratch pad, run loaded program	DFFF FFFC <sub>H</sub> <sup>2)</sup> (D400 0000 <sub>H</sub> )		
		001	<b>Bootstrap Loader</b> Serial boot from CAN to PMI scratch pad, run loaded program			
		010	<b>Bootstrap Loader</b> Serial boot from SSC to PMI scratch pad, run loaded program			
				011	External memory, EBU as master	DFFF FFFC <sub>H</sub> <sup>2)</sup> (A000 0000 <sub>H</sub> )
				100	External memory, EBU as slave	DFFF FFFC <sub>H</sub> <sup>2)</sup> (A000 0000 <sub>H</sub> )
				101	Reserved (STOP)	----
				110	PMI scratch pad	D400 0000 <sub>H</sub>
				111	Reserved (STOP)	DFFF FFFC <sub>H</sub> <sup>2)</sup>
1	0	000-111	Reserved (STOP)	DFFF FFFC <sub>H</sub> <sup>2)</sup>		
0	1	000	Tristate chip	----		
		001	Go to external emulator space	DFFF FFFC <sub>H</sub> <sup>2)</sup> (DE00 0000 <sub>H</sub> )		
		010	Reserved (STOP)	----		
		011	OSC and PLL Bypass	----		
		100-111	Reserved (STOP)	DFFFFFFC <sub>H</sub> <sup>2)</sup>		
0	0	000-111	Reserved (STOP)	DFFFFFFC <sub>H</sub> <sup>2)</sup>		

<sup>1)</sup> This input signal is active low.

<sup>2)</sup> This is the BootROM entry address; the start address of user program in parentheses.

### 3.20 Power Management System

The TC1115 power management system allows software to configure the various processing units to adjust automatically in order to draw the minimum necessary power for the application.

There are four power management modes:

- Run Mode
- Idle Mode
- Sleep Mode
- Deep Sleep Mode

**Table 3-4** describes the features of the power management modes.

**Table 3-4 Power Management Mode Summary**

Mode	Description
<b>Run</b>	The system is fully operational. All clocks and peripherals are enabled, as determined by software.
<b>Idle</b>	The CPU clock is disabled, waiting for a condition to return it to run mode. Idle mode can be entered by software when the processor has no active tasks to perform. All peripherals remain powered and clocked. Processor memory is accessible to peripherals. A reset, Watchdog Timer event, a falling edge on the NMI pin, or any enabled interrupt event will return the system to run mode.
<b>Sleep</b>	The system clock continues to be distributed only to those peripherals programmed to operate in sleep mode. The other peripheral modules will be shut down by the suspend signal. Interrupts from operating peripherals, the Watchdog Timer, a falling edge on the NMI pin, or a reset event will return the system to run mode. Entering this state requires an orderly shut-down controlled by the Power Management State Machine.
<b>Deep Sleep</b>	The system clock is shut off; only an external signal will restart the system. Entering this state requires an orderly shut-down controlled by the Power Management State Machine (PMSM).

Besides these explicit software-controlled power-saving modes, special attention has been paid in the TC1115 to automatic power-saving in operating units that are currently not required or idle. In this case, they are shut off automatically until their operation is required again.

### 3.21 On-Chip Debug Support

The On-Chip Debug Support of the TC1115 consists of the following building blocks:

- OCDS L1 module of TriCore™
- OCDS L2 interface of TriCore™
- OCDS L1 module in the BCU of the FPI Bus
- OCDS L1 facilities within the DMA
- OCDS L2 interface of DMA
- OCDS System Control Unit (OSCU)
- Multi Core Break Switch (MCBS)
- JTAG based Debug Interface (Cerberus JDI)
- Suspend functionality of peripherals

#### Features:

- TriCore™ L1 OCDS:
  - Hardware event generation unit
  - Break by DEBUG instruction or break signal
  - Full Single-Step support in hardware, possible also with software break
  - Access to memory, SFRs, etc. on the fly
- DMA L1 OCDS:
  - Output break request on errors
  - Suspension of pre-selected channels
- Level 2 trace port with 16 pins that outputs either TriCore™, or DMA trace
- OCDS System Control Unit (Cerberus OSCU)
  - Minimum number of pins required (no OCDS enable pin)
  - Hardware allows hot attach of a debugger to a running system
  - System is secure (can be locked from internal)
- Multi Core Break Switch (Cerberus MCBS):
  - TriCore™, DMA, break pins, and BCUs as break sources
  - TriCore™ as break targets; other parts can in addition be suspended
  - Synchronous stop and restart of the system
  - Break to Suspend converter

**Figure 3-13** shows a basic block diagram of the building blocks.

Figure 3-13 OCDS Support Basic Block Diagram

### 3.22 Clock Generation Unit

The Clock Generation Unit (CGU) allows a flexible clock generation for TC1115. The power consumption is indirectly proportional to the frequency, whereas the performance of the microcontroller is directly proportional to the frequency. During user program execution the frequency can be programmed for an optimal ratio between performance and power consumption. Therefore, the power consumption can be adapted to the actual application state.

#### Features:

The Clock Generation Unit serves several purposes:

- PLL feature for multiplying clock source by different factors
- Direct Drive for direct clock input
- Comfortable state machine for secure switching between basic PLL, direct, or prescaler operation
- Sleep and power-down mode support

The Clock Generation Unit in the TC1115, shown in **Figure 3-14**, consists of an oscillator circuit and one Phase-Locked Loop (PLL). The PLL can convert a low-frequency external clock signal to a high-speed internal clock for maximum performance. The PLL also has fail-safe logic that detects degenerate external clock behavior such as abnormal frequency deviations or a total loss of the external clock. It can execute emergency actions if it loses the lock on the external clock.

In general, the Clock Generation Unit (CGU) is controlled through the System Control Unit (SCU) module of the TC1115.

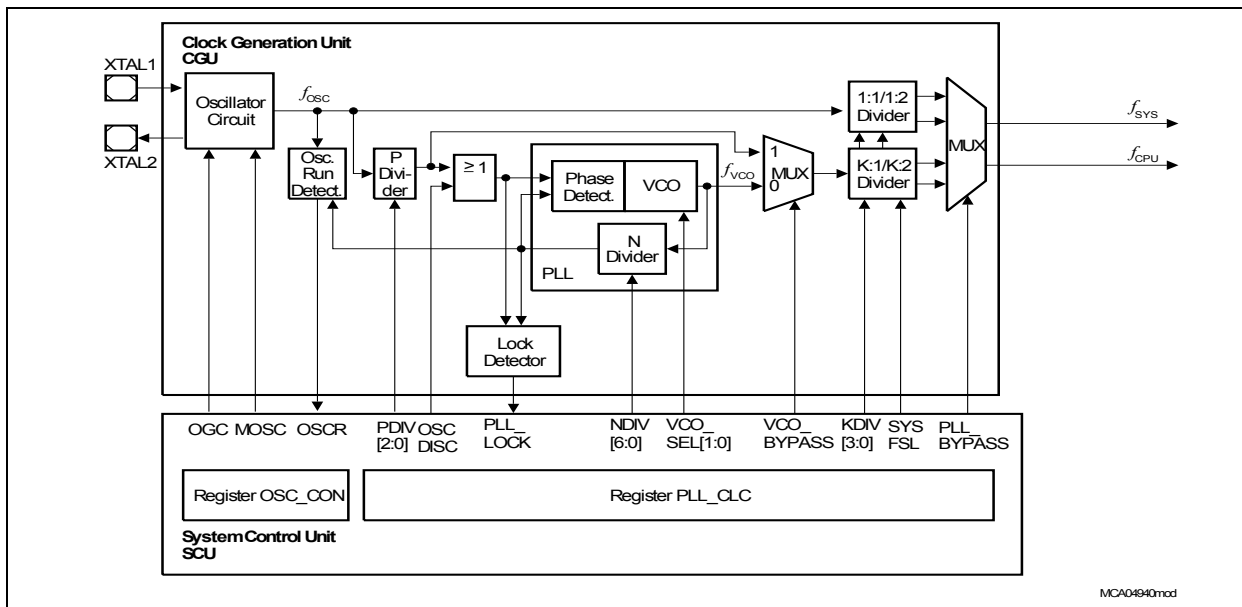

Figure 3-14 Clock Generation Unit Block Diagram

**Advance Information**

**Functional Description**

The oscillator circuit, which is designed to work with an external crystal oscillator or an external stable clock source, consists of an inverting amplifier with XTAL1 as input and XTAL2 as output.

**Figure 3-15** shows the recommended external oscillator circuitries for both operating modes, i.e. external crystal mode and external input clock mode.

**Figure 3-15 Oscillator Circuitries**

When using an external clock signal, it must be connected to XTAL1 and XTAL2 is left open (unconnected). When supplying the clock signal directly, not using a crystal and the oscillator, the input frequency can be in the range of 0 - 40 MHz if the PLL is not used, 4 - 40 MHz in case the PLL is used.

When using a crystal, its frequency can be within the range of 4 MHz to 25 MHz. An external oscillator load circuitry must be used, connected to both pins, XTAL1 and XTAL2. It consists normally of the two load capacitances, C1 and C2. For some crystals, a series damp resistor may be necessary. The exact values and related operating range are dependant on the crystal and have to be determined and optimized together with the crystal vendor using the negative resistance method. As starting point for the evaluation and for non-productive systems, the following load capacitor values might be used.

**Table 3-5 Load Capacitors Select**

Fundamental Mode Crystal Frequency (approx., MHz)	Load Capacitors C1, C2 (pF)
4	33
8	18
12	12
16	10

Advance Information

Functional Description

**Table 3-5 Load Capacitors Select (cont'd)**

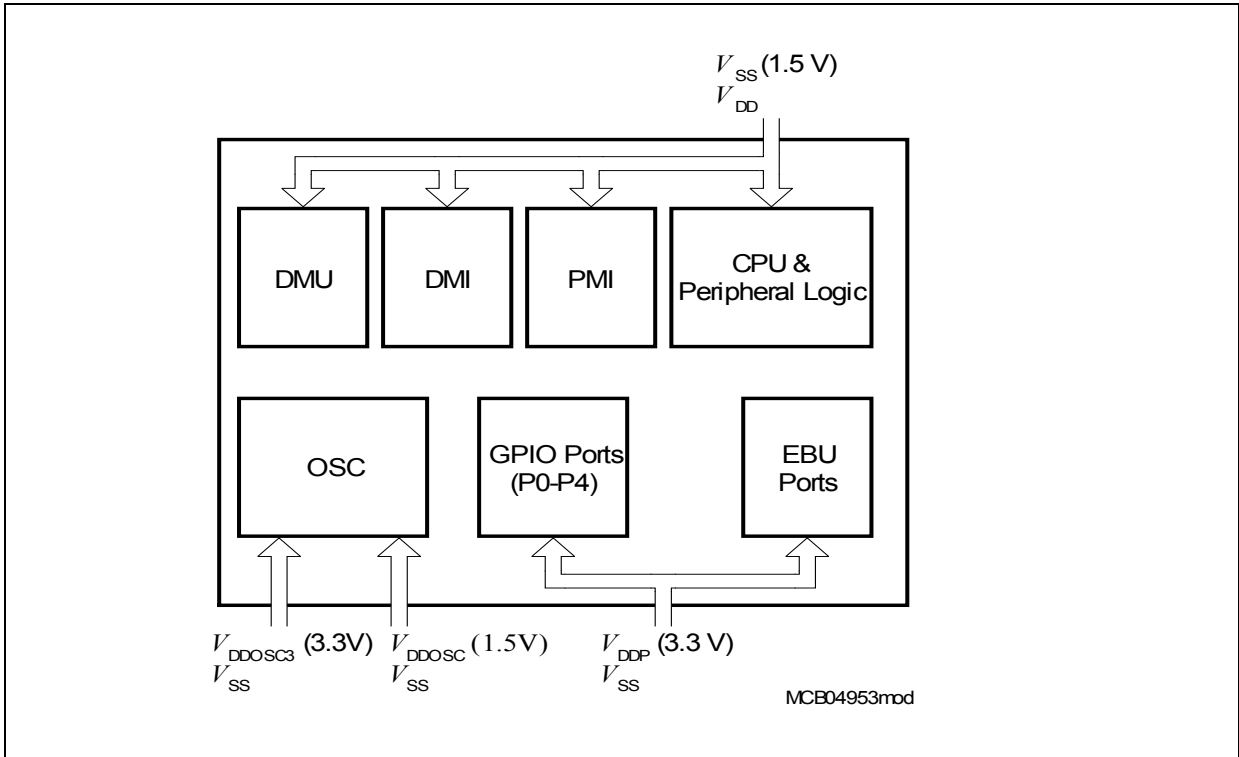

Fundamental Mode Crystal Frequency (approx., MHz)	Load Capacitors C1, C2 (pF)
20	10
24	10

A block capacitor between  $V_{DDOSC3}$  and  $V_{SSOSC}$ ,  $V_{DDOSC}$  and  $V_{SSOSC}$  is recommended, too.

### 3.23 Power Supply

The TC1115 provides an ingenious power supply concept in order to improve the EMI behavior as well as to minimize the crosstalk within on-chip modules.

**Figure 3-16** shows the TC1115's power supply concept, where certain logic modules are individually supplied with power. This concept improves the EMI behavior by reduction of the noise cross coupling.

**Figure 3-16 TC1115 Power Supply Concept**

### 3.24 Power Sequencing

During power-up, reset pin  $\overline{\text{PORST}}$  has to be held active until both power supply voltages have reached at least their minimum values.

During the power-up time (rising of the supply voltages from 0 to their regular operating values), it must be ensured, that the core  $V_{\text{DD}}$  power supply reaches its operating value first, and then followed by the GPIO  $V_{\text{DDP}}$  power supply. During the rising time of the core voltage, it must be ensured that  $0 < V_{\text{DD}} - V_{\text{DDP}} < 0.5 \text{ V}$ .

During power-down, the core power supply  $V_{\text{DD}}$  and GPIO power supply  $V_{\text{DDP}}$  must be switched off completely until all capacitances are discharged to zero before the next power-up.

*Note: The state of the pins are undefined when only the port voltage  $V_{\text{DDP}}$  is switched on.*

## 4 Electrical Parameters

### 4.1 General Parameters

#### 4.1.1 Parameter Interpretation

The parameters listed in this section represent partly the characteristics of the TC1115 and partly its requirements on the system. To aid interpreting the parameters easily when evaluating them for design purposes, they are indicated by the abbreviations in the "Symbol" column:

- **CC**  
These parameters indicate **C**ontroller **C**haracteristics, which are distinctive features of the TC1115 and must be considered for system design.
- **SR**  
These parameters indicate **S**ystem **R**equirements, which must be provided by the microcontroller system in which the TC1115 is included.

## Advance Information

## Electrical Parameters

## 4.1.2 Absolute Maximum Rating

Parameter	Symbol	Limit Values		Unit	Notes
		min.	max.		
Ambient temperature	$T_A$	-40	85	°C	under bias
Storage temperature	$T_{ST}$	-65	150	°C	–
Junction temperature	$T_J$	-40	125	°C	under bias
Voltage at 1.5 V power supply pins with respect to $V_{SS}$ <sup>1)</sup>	$V_{DD}$	-0.5	1.7	V	–
Voltage at 3.3 V power supply pins with respect to $V_{SS}$ <sup>2)</sup>	$V_{DDP}$	-0.5	4.0	V	–
Voltage on any pin with respect to $V_{SS}$ <sup>2)</sup>	$V_{IN}$	-0.5	4.0	V	–
Input current on any pin during overload condition	$I_{IN}$	-10	10	mA	–
Absolute sum of all input currents during overload condition	$\Sigma I_{IN}$	–	100	mA	–
CPU & LMB Bus Frequency	$f_{SYS}$	–	150	MHz	–
FPI Bus Frequency	$f_{FPI}$	–	100	MHz	–

1) Applicable for  $V_{DD}$  and  $V_{DDOSC}$ .

2) Applicable for  $V_{DDP}$  and  $V_{DDOSC3}$ . The maximum voltage difference must not exceed 4.0 V in any case (i.e. Supply Voltage = 4.0 V and Input Voltage = -0.5 V is not allowed).

**Note:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. During absolute maximum rating overload conditions ( $V_{IN} > V_{DD}$  or  $V_{IN} < V_{SS}$ ) the voltage on  $V_{DD}$  pins with respect to ground ( $V_{SS}$ ) must not exceed the values defined by the absolute maximum ratings.

**Advance Information**
**Electrical Parameters**
**4.1.3 Operating Condition**

The following operating conditions must be complied with in order to ensure correct operation of the TC1115. All parameters specified in the following table refer to these operating conditions, unless otherwise indicated.

Parameter	Symbol	Limit Values		Unit	Notes Conditions
		min.	max.		
Digital supply voltage	$V_{DD}$	1.43	1.58	V	–
	$V_{DDP}$	3.14	3.47	V	–
Digital ground voltage	$V_{SS}$	0		V	–
Digital core supply current	$I_{DD}$	–	525	mA	–
Ambient temperature under bias	$T_A$	-40	+85	°C	–
CPU clock	$f_{SYS}$	– <sup>1)</sup>	150	MHz	–
Overload current	$I_{OV}$	-1	1	mA	2)3) duty cycle ≤ 25%
		-3	3		
Short circuit current	$I_{SC}$	-1	1	mA	4) duty cycle ≤ 25%
		-3	3		
Absolute sum of overload + short circuit currents	$\Sigma I_{OV}  +  I_{SC} $	–	50	mA	3) duty cycle ≤ 25%
			100		
Inactive device pin current ( $V_{DD} = V_{DDP} = 0$ )	$I_{ID}$	-1	1	mA	–
External load capacitance	$C_L$	–	50	pF	–
ESD strength	–	2000	–	V	Human Body Model (HBM)

1) The TC1115 uses a static design, so the minimum operation frequency is 0 MHz. However, due to test time restriction no lower frequency boundary is tested.

2) Overload conditions occur if the standard operating conditions are exceeded, i.e. the voltage on any pin exceeds the specified range (i.e.  $V_{OV} > V_{DDP} + 0.5\text{ V}$  or  $V_{OV} < V_{SS} - 0.5\text{ V}$ ). The absolute sum of input overload currents on all digital I/O pins may not exceed **50 mA**. The supply voltage must remain within the specified limits.

3) Not subject to production test, verified by design/characterization.

4) Applicable for digital inputs.

**Advance Information**
**Electrical Parameters**
**4.2.3 IIC Characteristics**

Each IIC Pin is an open drain output pin with different characteristics than other pins. The related characteristics are given in the following table.

Parameter	Symbol	Limit Values		Unit	Test Conditions
		min.	max.		
Output low voltage	$V_{OL}$ CC	–	0.4 0.6	V	3 mA sink current 6 mA sink current
Input high voltage <sup>1)</sup>	$V_{IH}$ SR	$0.7V_{DDP}$	$V_{DDP}+0.5$	V	–
Input low voltage <sup>1)</sup>	$V_{IL}$ SR	-0.5	$0.3V_{DDP}$	V	–

<sup>1)</sup> Not subject to production test, verified by design/characterization.

*Note: No 5 V IIC interface is supported with these pads. Only voltages lower than 3.63 V must be applied to these pads.*

*Note: IIC pins have no pull-up and pull-down devices.*

**Advance Information**
**Electrical Parameters**
**4.2.4 Power Supply Current**

Parameter	Symbol	Limit Values		Unit	Test Conditions
		typ. <sup>1)</sup>	max.		
Active mode supply current	$I_{DD}$	314	679	mA	Sum of $I_{DDS}$ <sup>2)</sup>
		153	345	mA	$I_{DD}$ at $V_{DD}$ <sup>3)</sup>
		156	322	mA	$I_{DD}$ at $V_{DDP}$
Idle mode supply current	$I_{ID}$	74	154	mA	Sum of $I_{DDS}$ <sup>2)4)</sup>
		66	130	mA	$I_{DD}$ at $V_{DD}$ <sup>3)4)</sup>
		6	15	mA	$I_{DD}$ at $V_{DDP}$ <sup>4)</sup>
Deep sleep mode supply current	$I_{DS}$	2	19	mA	Sum of $I_{DDS}$ <sup>2)5)</sup>
		2	19	mA	$I_{DD}$ at $V_{DD}$ <sup>3)5)</sup>
		3.6	58	$\mu$ A	$I_{DD}$ at $V_{DDP}$ <sup>5)</sup>

- 1) Typical values are measured at 25°C, CPU clock at 150 MHz, and nominal supply voltage that is 3.3 V for  $V_{DDP}$ ,  $V_{DDOSC3}$  and 1.5 V for  $V_{DD}$ ,  $V_{DDOSC}$ . These currents are measured using a typical application pattern. The power consumption of modules can increase or decrease using other application programs.
- 2) These power supply currents are defined as the sum of all currents at the  $V_{DD}$  power supply lines:  $V_{DD} + V_{DDP} + V_{DDOSC3} + V_{DDOSC}$
- 3) This measurement includes the TriCore™ and Logic power supply lines.
- 4) CPU is in idle state, input clocks to all peripherals are enabled.
- 5) Clock generation is disabled at the source.

**Advance Information**
**Electrical Parameters**
**4.3 AC Parameters**
**4.3.1 Power, Pad and Reset Timing**

Parameter	Symbol	Limit Values		Unit
		min.	max.	
Min. $V_{DDP}$ voltage to ensure defined pad states <sup>1)</sup>	$V_{DDPPA}$ CC	0.6	–	V
Oscillator start-up time <sup>2)</sup>	$t_{OSCS}$ CC	–	30	ms
Minimum $\overline{PORST}$ active time after power supplies are stable at operating levels	$t_{POA}$ CC	50	–	ms
$\overline{HDRST}$ pulse width	$t_{HD}$ CC	1024 cycles <sup>3)</sup>		$f_{SYS}$
Ports inactive after any reset active <sup>2)</sup>	$t_{PI}$ CC	–	30	ns

- 1) This parameter is valid under assumption that  $\overline{PORST}$  signal is constantly at low level during the power-up/ power-down of the  $V_{DDP}$ .
- 2) Not subject to production test, verified by design/characterization.
- 3) Any  $\overline{HDRST}$  activation is internally prolonged to 1024 FPI bus clock cycles.

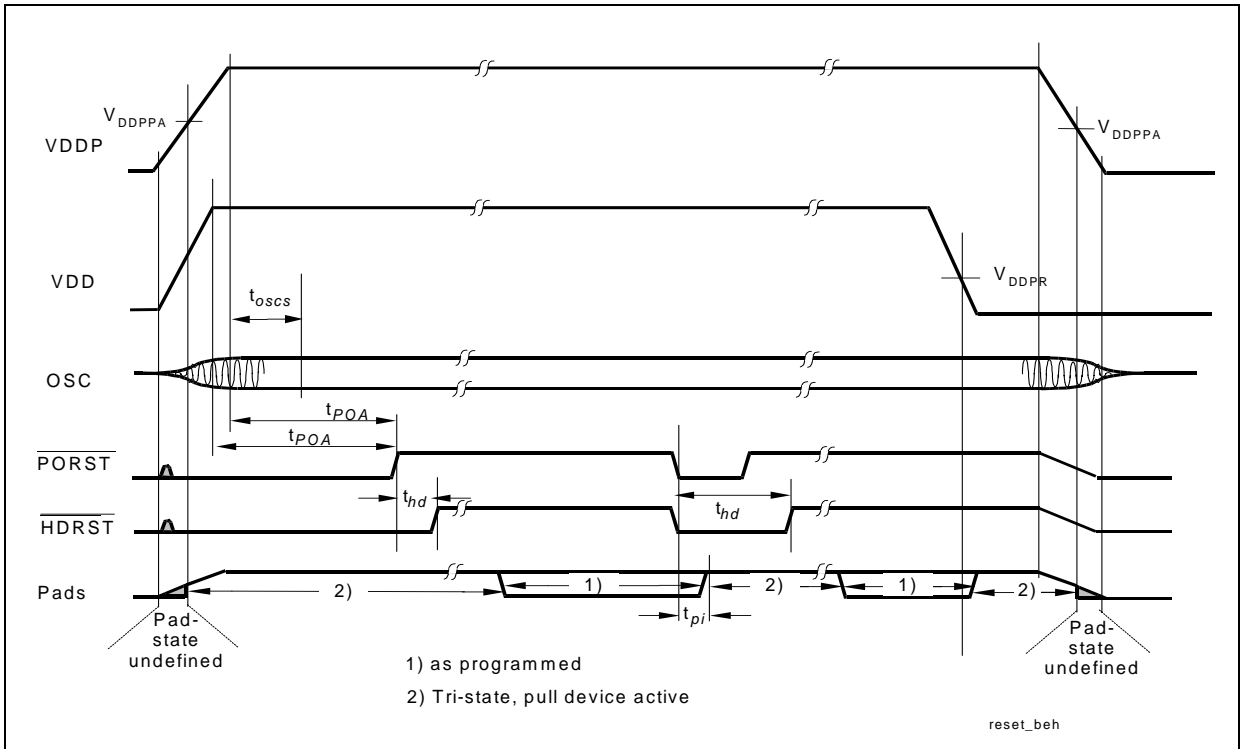

Figure 4-1 Power and Reset Timing

### 4.3.2 PLL Parameters

When PLL operation is configured ( $PLL\_CLC.LOCK = 1$ ), the on-chip phase locked loop is enabled and provides the master clock. The PLL multiplies the input frequency by the factor  $F$  ( $f_{MC} = f_{OSC} \times F$ ) which results from the input divider, the multiplication factor (N Factor), and the output divider ( $F = NDIV+1 / (PDIV+1 \times KDIV+1)$ ). The PLL circuit synchronizes the master clock to the input clock. This synchronization is done smoothly, i.e. the master clock frequency does not change abruptly.

Due to this adaptation to the input clock, the frequency of  $f_{MC}$  is constantly adjusted so it is locked to  $f_{OSC}$ . The slight variation causes a jitter of  $f_{MC}$  which also affects the duration of individual TCMs.

The timing listed in the AC Characteristics refers to TCPs. Because  $f_{CPU}$  is derived from  $f_{MC}$ , the timing must be calculated using the minimum TCP possible under the respective circumstances.

The actual minimum value for TCP depends on the jitter of the PLL. As the PLL is constantly adjusting its output frequency in order to correspond to the applied input frequency (crystal or oscillator), the relative deviation for periods of more than one TCP is lower than for one single TCP (see formula and [Figure 4-2](#)).

This is especially important for bus cycles using waitstates and for the operation of timers, serial interfaces, etc. For all slower operations and longer periods (e.g. pulse train generation or measurement, lower baud rates, etc.) the deviation caused by the PLL jitter is negligible.

The value of the accumulated PLL jitter depends on the number of consecutive VCO output cycles within the respective timeframe. The VCO output clock is divided by the output prescaler ( $K = KDIV+1$ ) to generate the master clock signal  $f_{MC}$ . Therefore, the number of VCO cycles can be represented as  $K \times N$ , where  $N$  is the number of consecutive  $f_{MC}$  cycles (TCM).

For a period of  $N \times TCM$ , the accumulated PLL jitter is defined by the corresponding deviation  $D_N$ :

$D_N$  [ns] =  $\pm(1.5 + 6.32 \times N / f_{MC})$ ;  $f_{MC}$  in [MHz],  $N$  = number of consecutive TCMs.

So, for a period of 3 TCMs @ 20 MHz and  $K = 12$ :  $D_3 = \pm(1.5 + 6.32 \times 3 / 20) = 2.448$  ns.

This formula is applicable for  $K \times N < 95$ . For longer periods, the  $K \times N = 95$  value can be used. This steady value can be approximated by:  $D_{Nmax}$  [ns] =  $\pm(1.5 + 600 / (K \times f_{MC}))$ .

**Figure 4-2** Approximated Accumulated PLL Jitter

*Note: The bold lines indicate the minimum accumulated jitter which can be achieved by selecting the maximum possible output prescaler factor  $K$ .*

Different frequency bands can be selected for the VCO, so the operation of the PLL can be adjusted to a wide range of input and output frequencies:

**Table 4-1** VCO Bands for PLL Operation

PLL_CLC.VCOSEL	VCO Frequency Range	Base Frequency Range <sup>1)</sup>
00	400 ... 500 MHz	250 ... 320 MHz
01	500 ... 600 MHz	300 ... 400 MHz
10	600 ... 700 MHz	350 ... 480 MHz
11	Reserved <sup>2)</sup>	

<sup>1)</sup> Base Frequency Range is the free running operation frequency of the PLL, when no input clock is available.

<sup>2)</sup> This option cannot be used.

### 4.3.3 AC Characteristics

(Operating Conditions apply)

**Figure 4-3 Input/Output Waveforms for AC Tests**  
**- for GPIO, Dedicated and EBU pins**

Advance Information

Electrical Parameters

4.3.4 Input Clock Timing

(Operating Conditions apply)

Parameter		Symbol	Limits		Unit
			min	max	
Oscillator clock frequency	with PLL	$f_{OSC}$ SR	4	25	MHz
Input clock frequency driving at XTAL1	with PLL	$f_{OSCDD}$ SR	-	40	MHz
Input Clock Duty Cycle ( $t_1 / t_2$ )		SR	45	55	%

Figure 4-4 Input Clock Timing

Advance Information

Electrical Parameters

4.3.5 Port Timing

(Operating Conditions apply;  $C_L = 50 \text{ pF}$ )

Parameter	Symbol	Limits		Unit
		min	max	
Port data valid from TRCLK <sup>1)</sup> up to 120 MHz <sup>2)</sup>	$t_1$ CC	–	13	ns

1) Port data is output with respect to the FPI clock. The TRCLK is used as a reference here since the FPI clock is not available as an external pin and TRCLK is same frequency as CPU clock. Port lines maintain their states for at least 2 CPU clocks.

2) 120 MHz is verified by design/characterization.

Figure 4-5 Port Timing

### 4.3.6 Timing for JTAG Signals

(Operating Conditions apply;  $C_L = 50 \text{ pF}$ )

Parameter	Symbol	Limits		Unit
		min	max	
TCK clock period	$t_{TCK}$ SR	50	–	ns
TCK high time	$t_1$ SR	10	–	ns
TCK low time	$t_2$ SR	29	–	ns
TCK clock rise time	$t_3$ SR	–	0.4	ns
TCK clock fall time	$t_4$ SR	–	0.4	ns

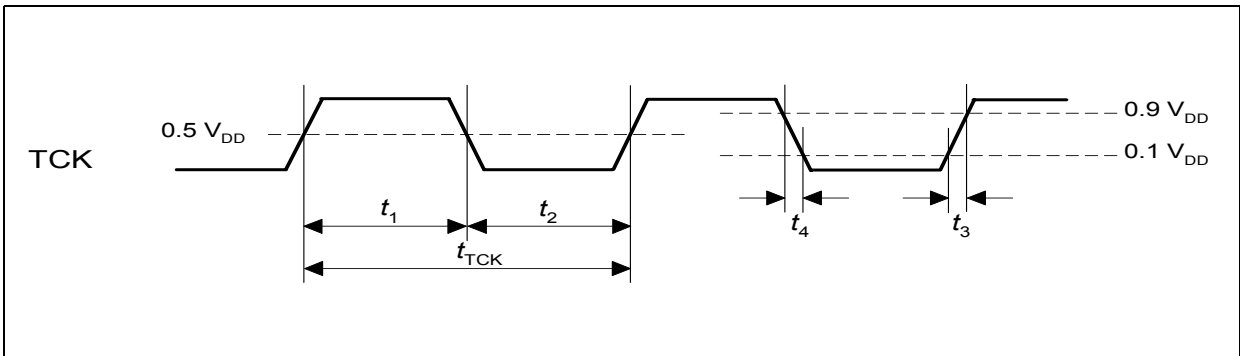

Figure 4-6 TCK Clock Timing

Parameter	Symbol	Limits		Unit
		min	max	
TMS setup to TCK ↗	$t_1$ SR	7.85	–	ns
TMS hold to TCK ↘	$t_2$ SR	3.0	–	ns
TDI setup to TCK ↗	$t_1$ SR	10.9	–	ns
TDI hold to TCK ↘	$t_2$ SR	3.0	–	ns
TDO valid output from TCK ↘	$t_3$ CC	–	10.7	ns
TDO high impedance to valid output from TCK ↘	$t_4$ CC	–	23.0	ns
TDO valid output to high impedance from TCK ↘	$t_5$ CC	–	26.0	ns

Figure 4-7 JTAG Timing

### 4.3.7 Timing for OCDS Trace and Breakpoint Signals

(Operating Conditions apply;  $C_L(\text{TRCLK}) = 25 \text{ pF}$ ,  $C_L = 50 \text{ pF}$ )

Parameter	Symbol	Limits		Unit
		min	max	
<u>BRK_OUT</u> valid from TRCLK $\nearrow$	$t_1$ CC	–	5.2	ns
<u>OCDS2_STATUS[4:0]</u> valid from TRCLK $\nearrow$	$t_1$ CC	0	5	ns
<u>OCDS2_INDIR_PC[7:0]</u> valid from TRCLK $\nearrow$	$t_1$ CC	0	5	ns
<u>OCDS2_BRKPT[2:0]</u> valid from TRCLK $\nearrow$	$t_1$ CC	0	5	ns

Figure 4-8 OCDS Trace Signals Timing

### 4.3.8 EBU Timings

#### 4.3.8.1 SDCLKO Output Clock Timing

(Operating Conditions apply; CL = 50 pF)

Parameter	Symbol	Limits <sup>1)</sup>		Limits <sup>2)</sup>		Unit
		min	max	min	max	
SDCLKO period	$t_1$ CC	10	–	8.3	–	ns
SDCLKO high time	$t_2$ CC	3	–	2.5	–	ns
SDCLKO low time	$t_3$ CC	3	–	2.5	–	ns
SDCLKO rise time	$t_4$ CC	–	2.5	–	2.5	ns
SDCLKO fall time	$t_5$ CC	–	2.5	–	2.5	ns

1) The parameters are applicable for PC100 SDRAM access and the maximum SDCLKO is up to 100 MHz.

2) The parameters are applicable for PC133 SDRAM access and the maximum SDCLKO is up to 120 MHz.

#### 4.3.8.2 BFCLKO Output Clock Timing

(Operating Conditions apply; C<sub>L</sub> = 50 pF)

Parameter	Symbol	Limit <sup>1)</sup>		Limit <sup>2)</sup>		Unit
		min	max	min	max	
Clock period	$t_1$ CC	20	–	16.7	–	ns
BFCLKO high time	$t_2$ CC	6.6	–	7.5	–	ns
BFCLKO low time	$t_3$ CC	6.6	–	7.5	–	ns
BFCLKO rise time	$t_4$ CC	–	3.5	–	3.5	ns
BFCLKO fall time	$t_5$ CC	–	2.5	–	2.5	ns

1) The CPU runs at 150 MHz and the Burst Flash runs at divided by 3 clock.

2) The CPU runs at 120 MHz and the Burst Flash runs at divided by 2 clock.

Figure 4-9 EBU Clock Output Timing

### 4.3.8.3 Timing for SDRAM Access Signals

(Operating Conditions apply; C<sub>L</sub> = 50 pF<sup>1)</sup>)

Parameter	Symbol	Limits <sup>2)</sup>		Limits <sup>3)</sup>		Unit
		min	max	min	max	
SDCLKO period	t <sub>1</sub> CC	10	–	8.3	–	ns
CKE output valid time from SDCLKO ↗	t <sub>1</sub> CC	–	8.0	–	6.8	ns
CKE output hold time from SDCLKO ↘	t <sub>2</sub> CC	0	–	0.8	–	ns
Address output valid time from SDCLKO ↗	t <sub>3</sub> CC	–	8.0	–	6.8	ns
Address output hold time from SDCLKO ↘	t <sub>4</sub> CC	1.0	–	0.8	–	ns
$\overline{\text{CSx}}$ , $\overline{\text{RAS}}$ , $\overline{\text{CAS}}$ , $\overline{\text{RD}}/\overline{\text{WR}}$ , $\overline{\text{BC}}(3:0)$ output valid time from SDCLKO ↗	t <sub>5</sub> CC	–	8.0	–	6.8	ns
$\overline{\text{CSx}}$ , $\overline{\text{RAS}}$ , $\overline{\text{CAS}}$ , $\overline{\text{RD}}/\overline{\text{WR}}$ , $\overline{\text{BC}}(3:0)$ output hold time from SDCLKO ↘	t <sub>6</sub> CC	1.0	–	0.8	–	ns
AD(31:0) output valid time from SDCLKO ↗	t <sub>7</sub> CC	–	8.0	–	6.8	ns
AD(31:0) output hold time from SDCLKO ↘	t <sub>8</sub> CC	1.0	–	0.8	–	ns
AD(31:0) input setup time to SDCLKO ↗	t <sub>9</sub> SR	4.0	–	2.9	–	ns
AD(31:0) input hold time from SDCLKO ↘	t <sub>10</sub> SR	3.0	–	3.0	–	ns

1) If application conditions other than 50 pf capacitive load are used, then the proper correlation factor should be used for your specific application condition. For design team, the load should be set according to the system requirement.

2) The parameters are applicable for PC100 SDRAM access and the maximum SDCLKO is up to 100 MHz.

3) The parameters are applicable for PC133 SDRAM access and the maximum SDCLKO is up to 120 MHz.

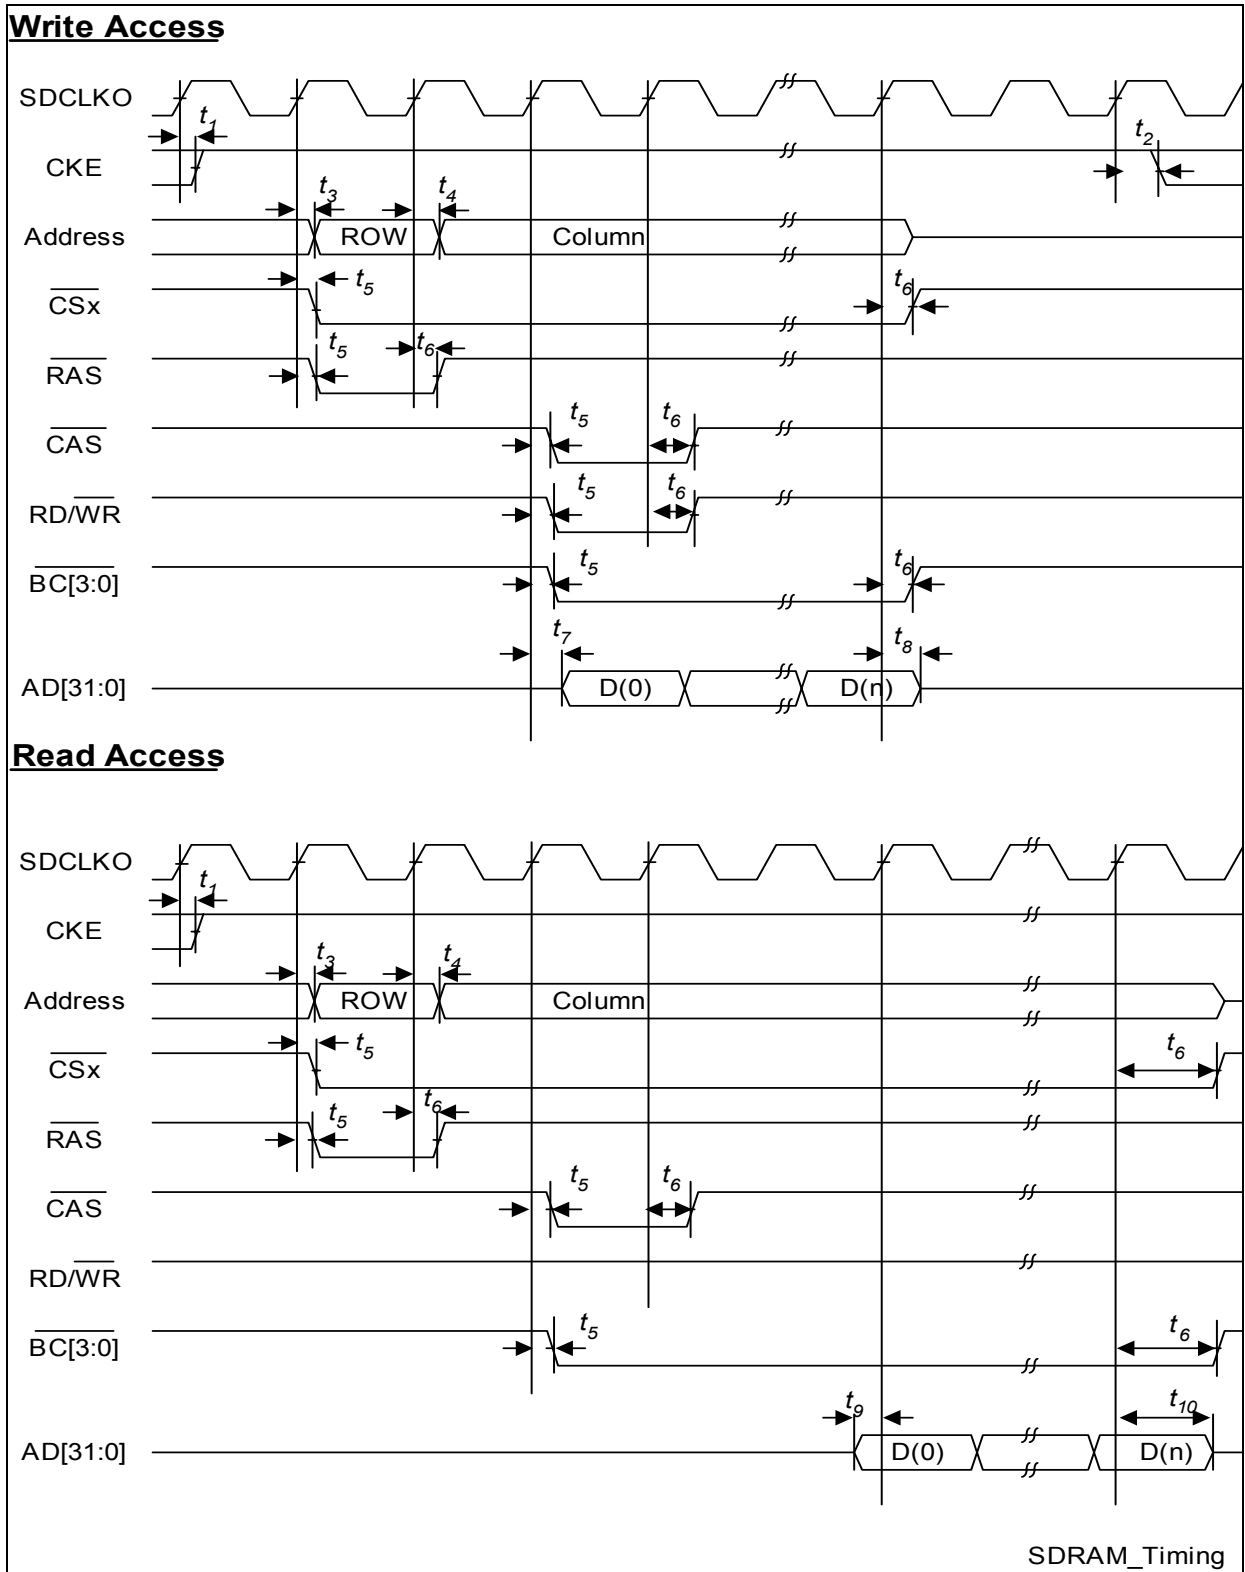

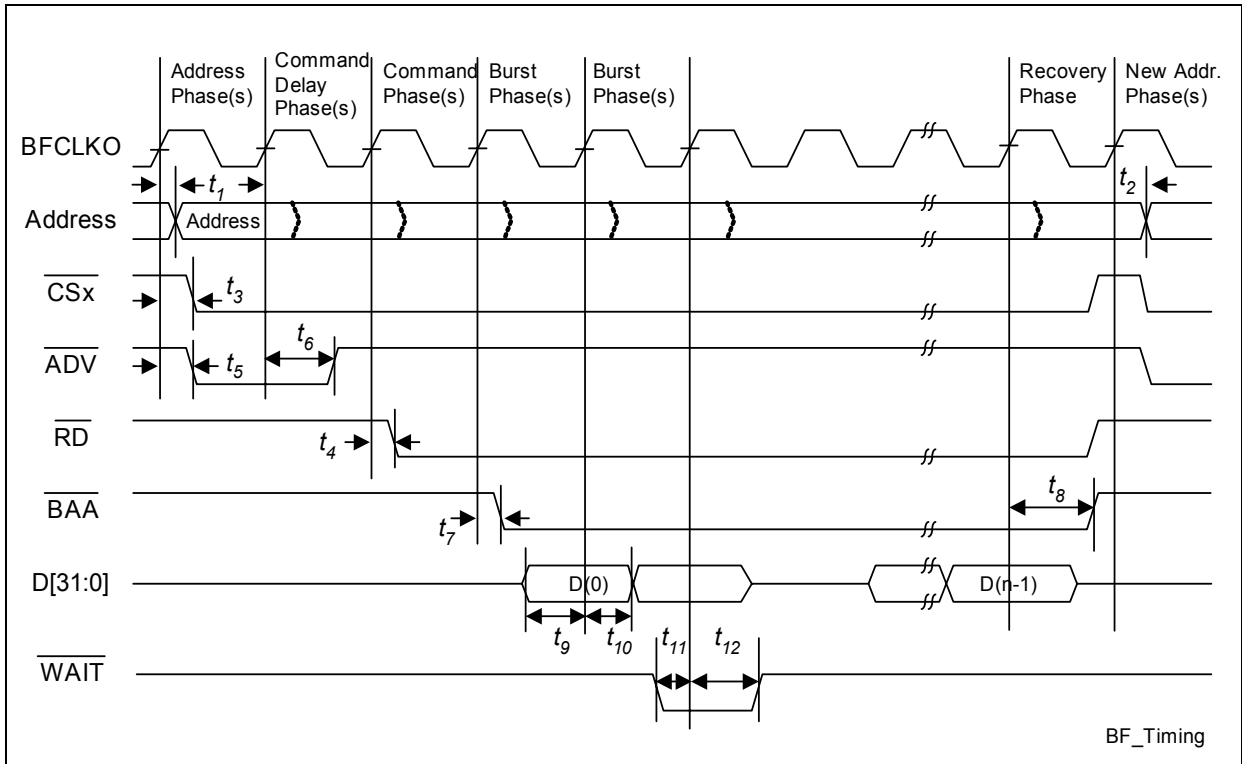

Figure 4-10 SDRAM Access Timing

**4.3.8.4 Timing for Burst Flash Access Signals**

 (Operating Conditions apply;  $C_L = 50 \text{ pF}$ )

Parameter	Symbol		Limits		Unit
			min	max	
Address output valid time from BFCLKO 	$t_1$	CC	–	11.0	ns
Address output hold time from BFCLKO 	$t_2$	CC	10.0	–	ns
CSx output valid time from BFCLKO 	$t_3$	CC	–	9.0	ns
RD output valid time from BFCLKO 	$t_4$	CC	–	10.0	ns
ADV output valid time from BFCLKO 	$t_5$	CC	–	10.0	ns
ADV output hold time from BFCLKO 	$t_6$	CC	3.0	–	ns
BAA output valid time from BFCLKO 	$t_7$	CC	–	10.0	ns
BAA output hold time from BFCLKO 	$t_8$	CC	3.0	–	ns
AD(31:0) input setup time to BFCLKO 	$t_9$	SR	5.0	–	ns
AD(31:0) input hold time from BFCLKO 	$t_{10}$	SR	3.0	–	ns
WAIT input setup time to BFCLKO 	$t_{11}$	SR	5.0	–	ns
WAIT input hold time from BFCLKO 	$t_{12}$	SR	3.0	–	ns

**Figure 4-11 Burst Flash Access Timing**

*Note: Output delays are always referenced to BFCLKO. The reference clock for input characteristics depends on bit BFCON.FDBKEN.*

*BFCON.FDBKEN = 0: BFCLKO is the input reference clock.*

*BFCON.FDBKEN = 1: BFCLKI is the input reference clock (EBULMB clock feedback enabled).*

**4.3.8.5 Timing for Demultiplexed Access Signals**

 (Operating Conditions apply;  $C_L = 50 \text{ pF}$ ) <sup>1)</sup>

Parameter	Symbol		Limits		Unit
			min	max	
$\overline{CSx}$ , $\overline{RD/WR}$ , $\overline{RD}$ , $\overline{MR/W}$ , $\overline{BC(3:0)}$ output valid time from output clock ↗	$t_1$	CC	–	9	ns
$\overline{CSx}$ , $\overline{RD/WR}$ , $\overline{RD}$ , $\overline{MR/W}$ , $\overline{BC(3:0)}$ output hold time from output clock ↗	$t_2$	CC	0.0	–	ns
Address output valid time from output clock ↗	$t_3$	CC	–	9	ns

- 1) The purpose for characterization of Asynchronous access is to provide the performance of all of the signals to user. User can decide whether an extra cycle is needed or not based on above parameters to generate signals with correct timing sequence. It is user's responsibility to program the correct phase length according to the memory/peripheral device specification and EBU specification.

Figure 4-12 Demultiplexed Asynchronous Device Access Timing

**4.3.8.6 Timing for Multiplexed Access Signals**

 (Operating Conditions apply;  $C_L = 50 \text{ pF}$ )<sup>1)</sup>

Parameter	Symbol	Limits		Unit
		min	max	
ALE, $\overline{\text{CSx}}$ , $\overline{\text{RD/WR}}$ , $\overline{\text{RD}}$ , $\overline{\text{MR/W}}$ , $\overline{\text{BC(3:0)}}$ output valid time from output clock 	$t_1$ CC	–	9	ns

User can decide whether an extra cycle is needed or not based on above parameters to generate signals with correct timing sequence. It is user's responsibility to program the correct phase length according to the memory/peripheral device specification and EBU Specification.

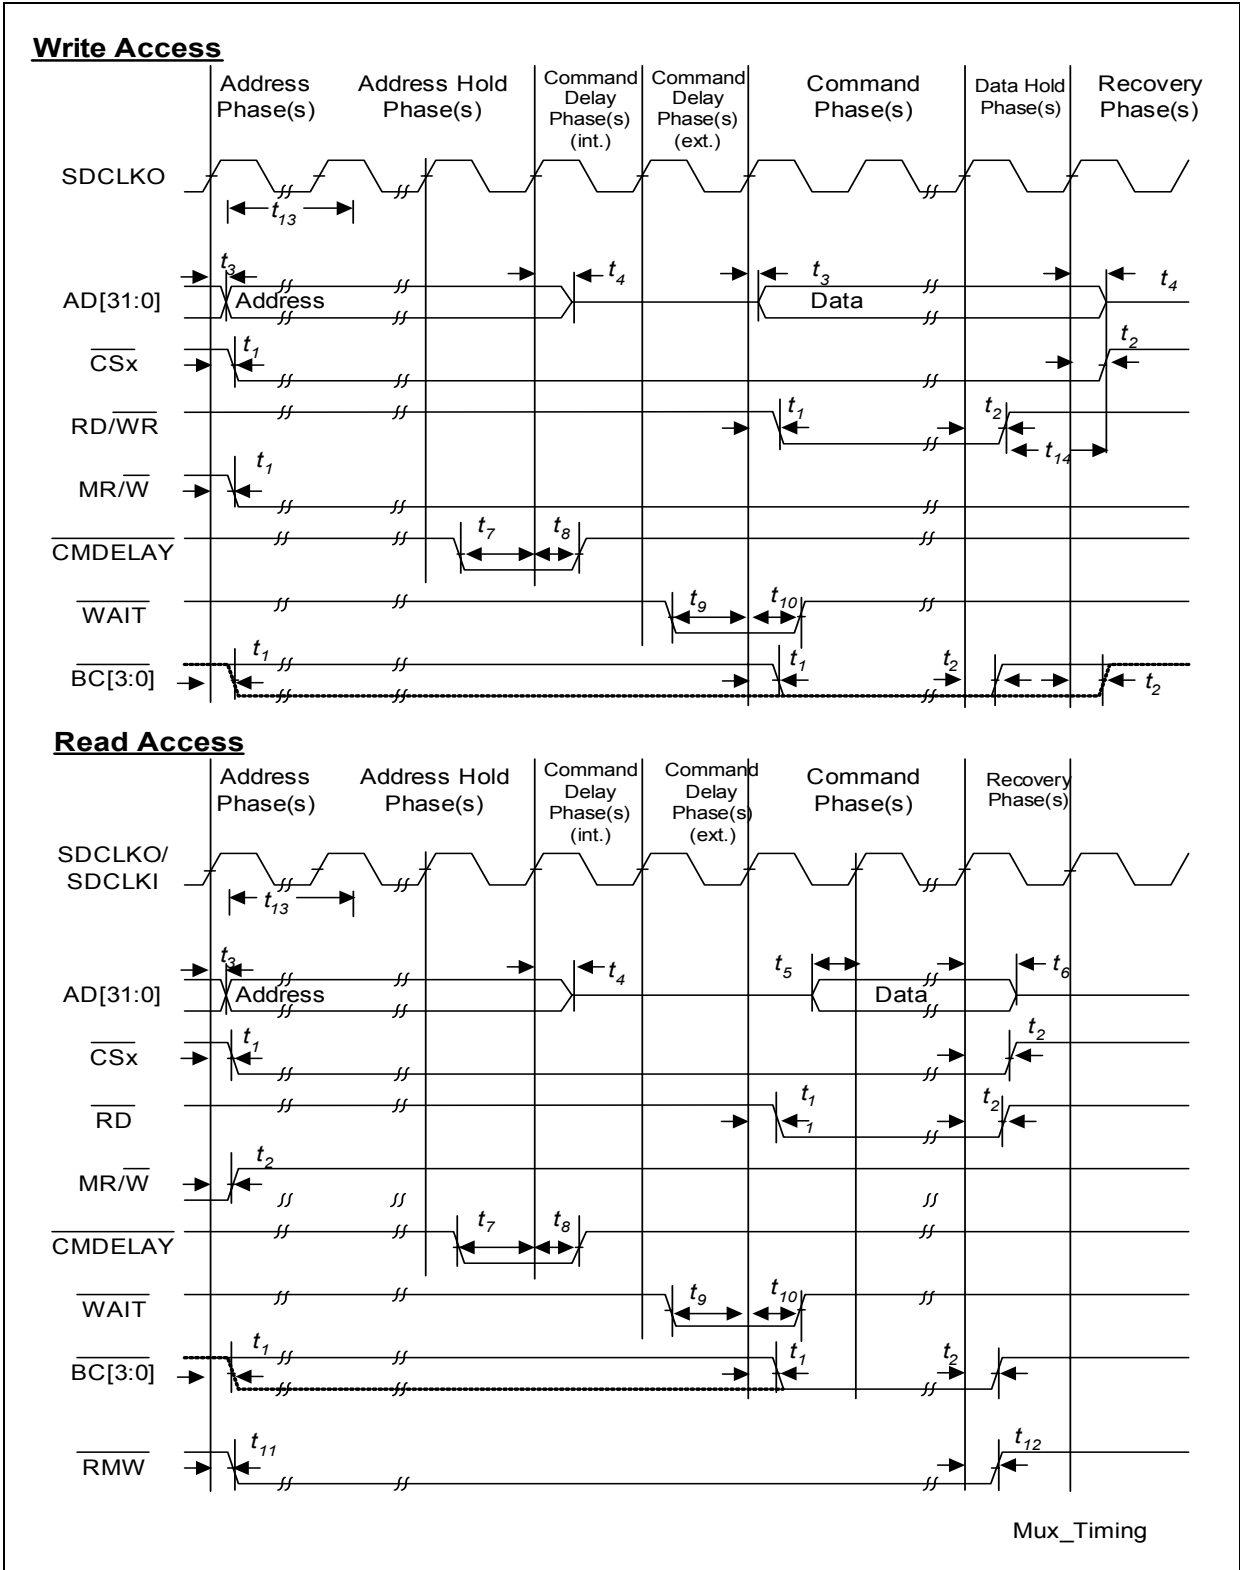

Figure 4-13 Write Access in Multiplexed Access

### 4.3.9 Peripheral Timings

#### 4.3.9.1 SSC Master Mode Timing

(Operating Conditions apply;  $C_L = 50 \text{ pF}$ )

Parameter	Symbol	Limit Values		Unit
		min.	max.	
SCLK clock period	$t_0$ CC	$2 \cdot T_{SSC}^{1)}$	–	ns
MTSR/SLSOx delay from SCLK ↗ ↘	$t_1$ CC	0	8	ns
MRST setup to SCLK ↘ ↗	$t_2$ SR	10	–	ns
MRST hold from SCLK ↘ ↗	$t_3$ SR	5	–	ns

1)  $T_{SSCmin} = T_{SYS} = 1/f_{SYS}$ . When  $f_{SYS} = 120\text{MHz}$ ,  $t_0 = 16.7\text{ns}$

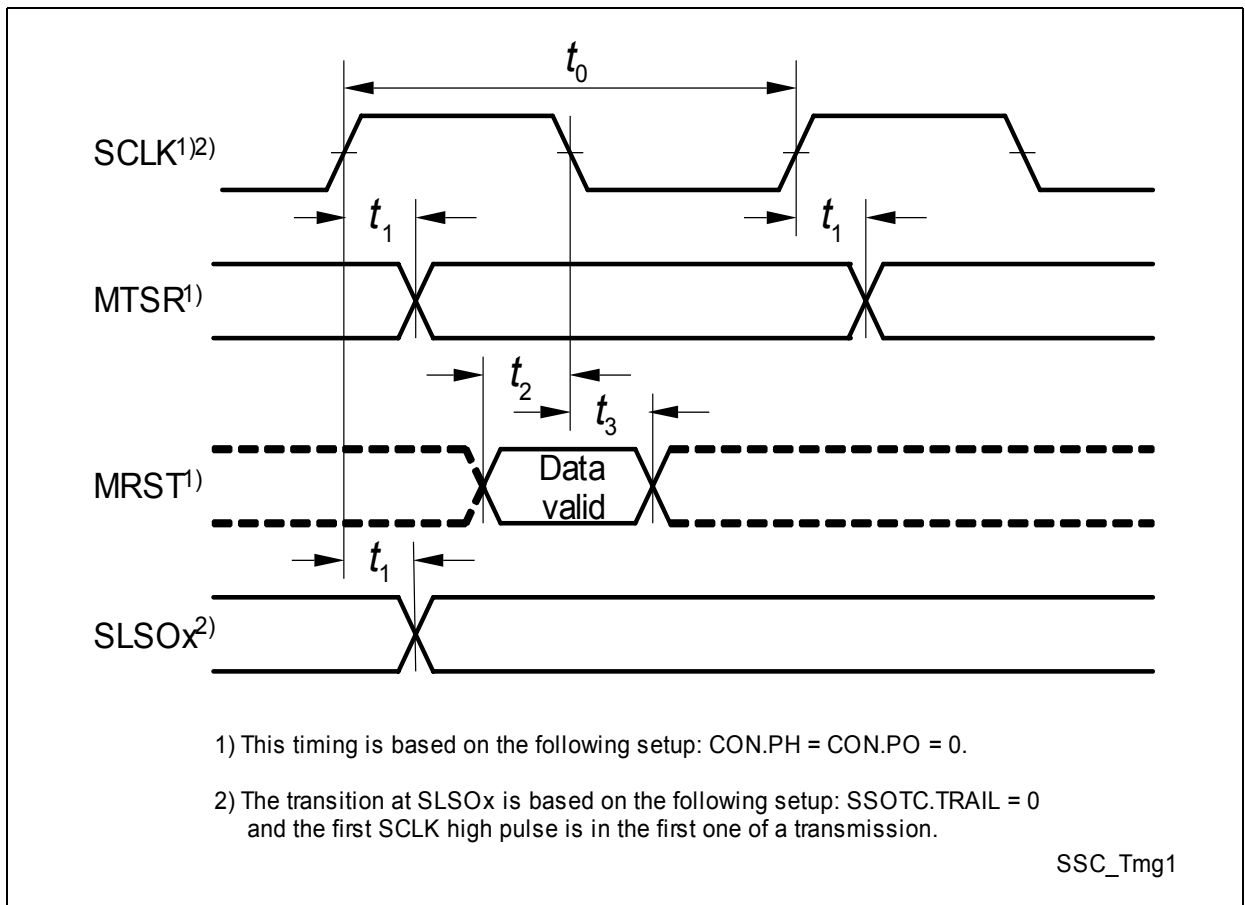

Figure 4-14 SSC Master Mode Timing

### 4.3.9.2 MLI Interface Timing

(Operating Conditions apply;  $C_L = 50 \text{ pF}$ )

Parameter	Symbol	Limit Values		Unit
		min.	max.	
TCLK/RCLK clock period	$t_0$ CC/SR	$2 \cdot T_{MLI}^{1)}$	–	ns
MLI outputs delay from TCLK ↗	$t_5$ CC	0	8	ns
MLI inputs setup to RCLK ↘	$t_6$ SR	4	–	ns
MLI inputs hold to RCLK ↘	$t_7$ SR	4	–	ns
RREADY output delay from TCLK ↘	$t_8$ CC	0	8	ns

1)  $T_{MLImin} = T_{SYS} = 1/f_{SYS}$ . When  $f_{SYS} = 120\text{MHz}$ ,  $t_0 = 16.7\text{ns}$

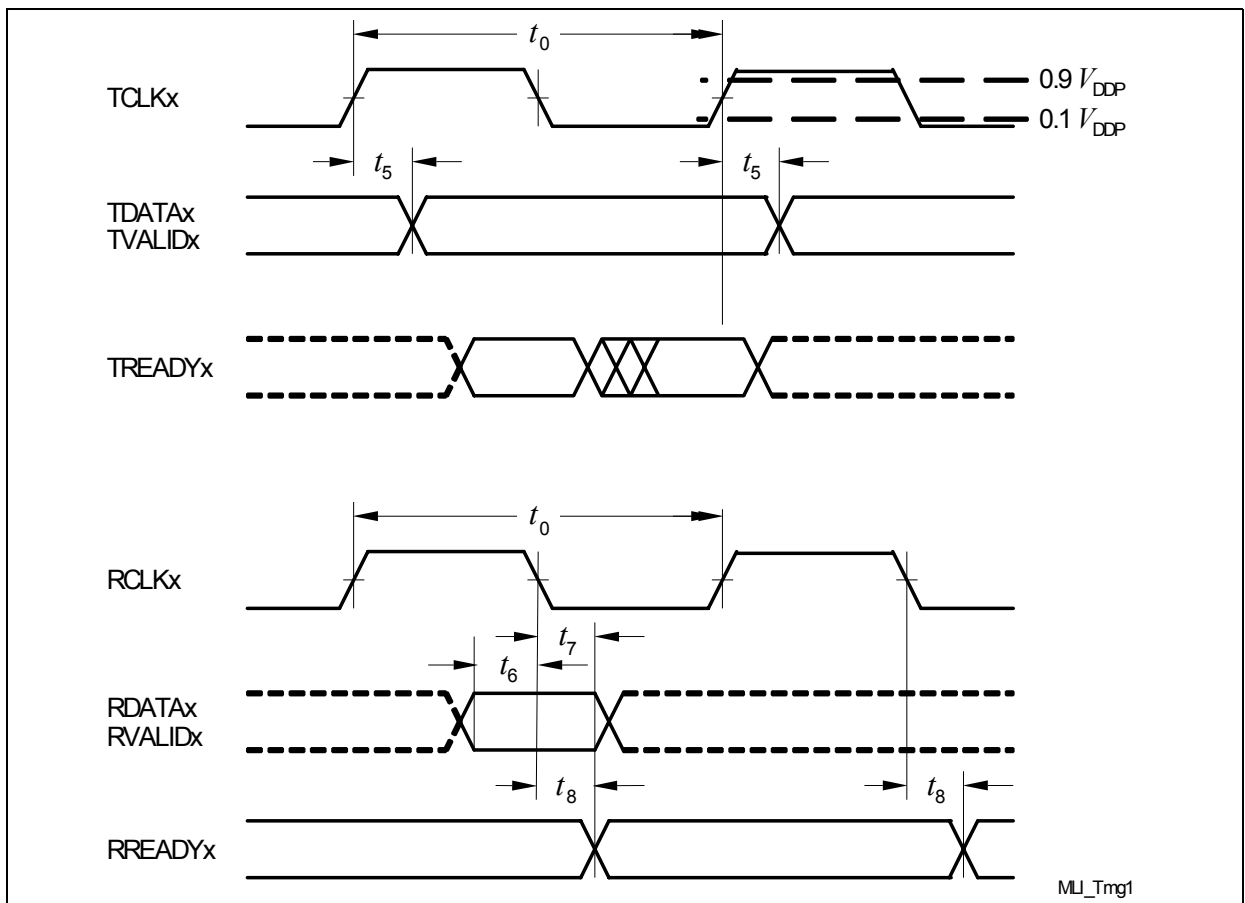

Figure 4-15 MLI Interface Timing

Note: The generation of RREADYx is in the input clock domain of the receiver. The reception of TREADYx is asynchronous to TCLKx.

## 5 Package Outline
