## Pin Descriptions

PIN				I/O†	DESCRIPTION‡
NAME	ALTERNATE FUNCTION	SDIP (64)	LCC (68)		
A0	DATA0	15	17	I/O	Single-chip mode: Port A is a general-purpose bidirectional I/O port. Expansion mode: Port A can be individually programmed as the external bidirectional data bus (DATA0–DATA7).
A1	DATA1	16	18		
A2	DATA2	17	19		
A3	DATA3	18	20		
A4	DATA4	19	21		
A5	DATA5	20	22		
A6	DATA6	21	23		
A7	DATA7	22	24		
B0	ADDR0	60	65	I/O	Single-chip mode: Port B is a general-purpose bidirectional I/O port. Expansion mode: Port B can be individually programmed as the low-order address output bus (ADDR0–ADDR7).
B1	ADDR1	61	66		
B2	ADDR2	62	67		
B3	ADDR3	63	68		
B4	ADDR4	64	1		
B5	ADDR5	1	2		
B6	ADDR6	2	3		
B7	ADDR7	3	4		
C0	ADDR8	4	5	I/O	Single-chip mode: Port C is a general-purpose bidirectional I/O port. Expansion mode: Port C can be individually programmed as the high-order address output bus (ADDR8–ADDR15).
C1	ADDR9	6	7		
C2	ADDR10	7	8		
C3	ADDR11	9	10		
C4	ADDR12	10	11		
C5	ADDR13	11	12		
C6	ADDR14	12	13		
C7	ADDR15	13	14		
INT1	NMI	50	52	I	External (nonmaskable or maskable) interrupt/general-purpose input pin
INT2	—	49	51	I/O	External maskable interrupt input/general-purpose bidirectional pin
INT3	—	48	50	I/O	External maskable interrupt input/general-purpose bidirectional pin
AN0	E0	14	36	I	ADC1 analog input (AN0–AN7) or positive reference pins (AN1–AN7) Port E can be individually programmed as general-purpose input pins if not used as ADC1 analog input or positive reference input.
AN1	E1	34	37		
AN2	E2	35	38		
AN3	E3	36	39		
AN4	E4	37	40		
AN5	E5	38	41		
AN6	E6	39	42		
AN7	E7	42	43		
VCC3		32	34		ADC1 positive-supply voltage and optional positive-reference input pin
VSS3		33	35		ADC1 ground reference pin
$\overline{\text{RESET}}$		51	53	I/O	System reset bidirectional pin. $\overline{\text{RESET}}$ , as an input, initializes the microcontroller; as open-drain output, $\overline{\text{RESET}}$ indicates an internal failure was detected by the watchdog or oscillator fault circuit.
MC		5	6	I	Mode control (MC) pin. MC enables EEPROM write-protection override (WPO) mode, also EPROM Vpp.
XTAL2/CLKIN		29	31	I O	Internal oscillator crystal input/external clock source input
XTAL1		30	32		
VCC1		31, 57	33, 61		Positive supply voltage
VCC2		—	15,63		Positive supply voltage

† I = input, O = output

‡ Ports A, B, C, and D can be configured only as general-purpose I/O pins. Also, port D3 can be configured as SYSCLK.

Pin Descriptions (Continued)

PIN		SDIP (64)	LCC (68)	I/O†	DESCRIPTION‡
NAME	ALTERNATE FUNCTION				
VSS1		8, 58,40	9		Ground reference for digital logic
VSS2		—	16,62		Ground reference for digital I/O logic
	<b>FUNCTION</b>				Single-chip mode: Port D is a general-purpose bidirectional I/O port. Each of the port D pins can be individually configured as a general-purpose I/O pin, primary memory control signal (function A), or secondary memory control signal (function B). All chip selects are independent and can be used for memory bank switching. Refer to Table 1 for function A memory accesses.
	<b>A</b> <b>B</b>				
D0	$\overline{\text{CSE2}}$ $\overline{\text{OCF}}$	59	64		I/O pin A: Chip select eighth output 2 goes low during memory accesses I/O pin B: Opcode fetch goes low during the opcode fetch memory cycle.

# TMS370Cx5x 8-BIT MICROCONTROLLER

SPNS010F – DECEMBER 1986 – REVISED FEBRUARY 1997

## functional block diagram

† For the 64-pin devices, there are only six pins for port D.

## description

The TMS370Cx5x family of single-chip 8-bit microcontrollers provides cost-effective real-time system control through integration of advanced peripheral function modules and various on-chip memory configurations. The TMS370Cx5x family presently consists of twenty-one devices which are grouped into seven main sub-families: the TMS370Cx50, TMS370Cx52, TMS370Cx53, TMS370Cx56, TMS370Cx58, TMS370Cx59, and SE370C75x.

The TMS370Cx5x family of devices is implemented using high-performance silicon-gate CMOS EPROM and EEPROM technologies. The low-operating power, wide-operating temperature range, and noise immunity of CMOS technology, coupled with the high performance and extensive on-chip peripheral functions, make the TMS370Cx5x devices attractive in system designs for automotive electronics, industrial motor control, computer peripheral control, telecommunications, and consumer application. Table 2 provides a memory configuration overview of the TMS370Cx5x devices.

§ Only operate up to 3 MHz SYSCLK

¶ System evaluators and development tools are for use only in a prototype environment, and their reliability has not been characterized.

# TMS370Cx5x 8-BIT MICROCONTROLLER

SPNS010F – DECEMBER 1986 – REVISED FEBRUARY 1997

## description (continued)

The suffix letter (A or B) appended to the device names shown in the device column of Table 2 indicates the configuration of the device. ROM or an EPROM devices have different configurations as indicated in Table 3. ROM devices with the suffix letter A are configured through a programmable contact during manufacture.

**Table 3. Suffix Letter Configuration**

DEVICE†	WATCHDOG TIMER	CLOCK	LOW-POWER MODE
EPROM A	Standard	Divide-by-4 (Standard oscillator)	Enabled
EPROM B	Hard	Divide-by-1 (PLL)	Enabled
ROM A	Standard	Divide-by-4 or Divide-by-1 (PLL)	Enabled or disabled
	Hard		
	Simple		
ROM-less A	Standard	Divide-by-4	Enabled

† Refer to the “device numbering conventions” section for device nomenclature and the “device part numbers” section for ordering.

Unless otherwise noted, the terms TMS370Cx50, TMS370Cx52, TMS370Cx53, TMS370Cx56, TMS370Cx58, TMS370Cx59, and SE370C75x refer to the individual devices listed in Table 2 and described in this data sheet. All TMS370Cx5x devices contain the following on-chip peripheral modules:

- Eight-channel, 8-bit analog-to-digital converter 1 (ADC1)
- Serial communications interface 1 (SCI1)
- Serial peripheral interface (SPI)
- One 24-bit general-purpose watchdog timer
- Two 16-bit general-purpose timers (one with an 8-bit prescaler)

TMS370C756, TMS370C758, and TMS370C759 are one-time programmable (OTP) devices that are available in plastic packages. This microcomputer is effective to use for immediate production updates for other members of the TMS370Cx5x family or for low-volume production runs when the mask charge or cycle time for low-cost mask ROM devices is not practical.

The SE370C756, SE370C758, and SE370C759 have windowed ceramic packages to allow reprogramming of the program EPROM memory during the development/prototyping phase of design. The SE370C75x devices allow quick updates to breadboards and prototype systems while iterating initial designs.

The TMS370Cx5x family provides two low-power modes (STANDBY and HALT) for applications where low-power consumption is critical. Both modes stop all central processing unit (CPU) activity (that is, no instructions are executed). In the STANDBY mode, the internal oscillator and the general-purpose timer remain active. In the HALT mode, all device activity is stopped. The device retains all RAM data and peripheral configuration bits throughout both low-power modes.

The TMS370Cx5x features advanced register-to-register architecture that allows direct arithmetic and logical operations without requiring an accumulator (for example, ADD R24, R47; add the contents of register 24 to the contents of register 47 and store the result in register 47). The TMS370Cx5x family is fully instruction-set-compatible, allowing easy transition between members of the TMS370 8-bit microcontroller family.

The SPI and the two operational modes of the SCI1 give three methods of serial communications. The SCI1 allows standard RS-232-C communications interface between other common data transmission equipment, while the SPI gives high-speed communications between simpler shift-register type devices, such as display drivers, ADC1 converter, phase-locked loop (PLL), I/O expansion, or other microcontrollers in the system.

## description (continued)

For large memory applications, the TMS370Cx5x family provides an external bus with non-multiplexed address and data. Precoded memory chip-select outputs can be enabled, which allows minimum-chip-count system implementations. Wait-state support facilitates performance matching among the CPU, external memory, and the peripherals. All pins associated with memory expansion interface are individually software configurable for general purpose digital input/output (I/O) pins when operating in the microcomputer mode.

The TMS370Cx5x family provides the system designer with very economical, efficient solution to real-time control applications. The TMS370 family extended development system (XDS™) and compact development tool (CDT™) solve the challenge of efficiently developing the software and hardware required to design the TMS370Cx5x into an ever-increasing number of complex applications. The application source code can be written in assembly and C-language, and the output code can be generated by the linker. The TMS370 family XDS development tools communicate through a standard RS-232-C interface with an existing personal computer. This allows the use of the personal computer editors and software utilities already familiar to the designer. The TMS370 family XDS emphasizes ease-of-use through extensive use of menus and screen windowing so that a system designer with minimal training can begin developing software. Precise real-time in-circuit emulation and extensive symbolic debug and analysis tools ensure efficient software and hardware implementation as well as reduced time-to-market cycle.

The TMS370Cx5x family together with the TMS370 family XDS/22, CDT370, design kit, starter kit, software tools, the SE370C75x reprogrammable devices, comprehensive product documentation, and customer support provide a complete solution to the needs of the system designer.

## modes

The TMS370Cx5x has four operating modes, two basic modes with each mode having two memory configurations. The basic operating modes are the microcomputer and microprocessor modes, which are selected by the voltage level applied to the dedicated MC pin two cycles before  $\overline{\text{RESET}}$  goes inactive. The two memory configurations then are selected through software programming of the internal system configuration registers. The four operating modes are the microcomputer single chip, microcomputer with external expansion, microprocessor without internal program memory, and microprocessor with internal program memory. These modes are described in the following list.

- Microcomputer single chip mode:
  - Operates as a self-contained microcomputer with all memory and peripherals on-chip.
  - Maximizes the general-purpose I/O capability for real-time control applications.
- Microcomputer with external expansion mode:
  - Supports bus expansion to external memory or peripherals, while all on-chip memory (RAM, ROM, EPROM, and data EEPROM) remains active.
  - Configures digital I/O ports (ports A, B, C, and D) through software, under control of the associated port control, to become external memory as follows:
    - Port A: 8-bit data memory
    - Port B and C: 16-bit address memory
    - Port D: 8-bit control memory (pin not used as function A or B can be configured as I/O)
  - Utilizes the pins available (not used for address, data, or control memory) as general-purpose input/output by programming them individually.
  - Lowers the system cost by not requiring an external address/data latch (address memory and data memory are nonmultiplexed).

XDS and CDT are trademarks of Texas Instruments Incorporated.

# TMS370Cx5x

## 8-BIT MICROCONTROLLER

SPNS010F – DECEMBER 1986 – REVISED FEBRUARY 1997

---

### modes (continued)

- Reduces external interface decode logic by using the precoded chip select outputs that provide direct memory/peripheral chip select or chip enable functions.
- Function A maps up to 112K bytes of external memory into the address space by using  $\overline{\text{CSE1}}$ ,  $\overline{\text{CSE2}}$ ,  $\overline{\text{CSH1}}$ ,  $\overline{\text{CSH2}}$ , and  $\overline{\text{CSH3}}$  as memory-bank selects under software control.
- Function B maps up to 40K bytes of external memory into the address space by using  $\overline{\text{EDS}}$  under software control.
- Microprocessor without internal program memory mode:
  - Ports A, B, C, and D (these ports are not programmable) become the address, data, and control buses for interface to external memory and peripherals.
  - On-chip RAM and data EEPROM remain active, while the on-chip ROM or EPROM is disabled.
  - Program area and the reset, interrupt, and trap vectors are located in off-chip memory locations.
- Microprocessor with internal program memory mode:
  - Configured as the microprocessor without internal program memory mode with respect to the external bus interface.
  - Application program in external memory enables the internal program ROM or EPROM to be active in the system. (Writing a zero to the MEMORY DISABLED control bit (SCCR1.2) of the SCCR1 control register accomplishes this.)

### memory/peripheral wait operation

The TMS370Cx5x enhances interface flexibility by providing  $\overline{\text{WAIT}}$ -state support, decoupling the cycle time of the CPU from the read/write access of the external memory or peripherals. External devices can extend the read/write accesses indefinitely by placing an active low on the  $\overline{\text{WAIT}}$ -input pin. The CPU continues to wait as long as  $\overline{\text{WAIT}}$  remains active.

Programmable automatic wait-state generation also is provided by the TMS370Cx5x on-chip bus controller. Following a hardware reset, the TMS370Cx5x is configured to add one wait state to all external bus transactions and memory and peripheral accesses automatically, thus making every external access a minimum of three system-clock cycles. The designer can disable the automatic wait-state generation if the AUTOWAIT DISABLE bit in SCCR1 is set to 1. Also, all accesses to the upper four frames of the peripheral file can be extended independently to four system clock cycles if the PF AUTO WAIT bit in SCCR0 is set to one. Programmable wait states can be used in conjunction with the external  $\overline{\text{WAIT}}$  pin. In applications where the external device read/write access can interface with the TMS370Cx5x CPU using one wait state, the automatic wait-state generation can eliminate external  $\overline{\text{WAIT}}$  interface logic, lowering system cost.

**CPU**

The CPU used on TMS370Cx5x devices is the high-performance 8-bit TMS370 CPU module. The 'x5x implements an efficient register-to-register architecture that eliminates the conventional accumulator bottleneck. The complete 'x5x instruction set is summarized in Table 23. Figure 1 illustrates the CPU registers and memory blocks.

† Reserved means the address space is reserved for future expansion.

**Figure 1. Programmer's Model**

# TMS370Cx5x 8-BIT MICROCONTROLLER

SPNS010F – DECEMBER 1986 – REVISED FEBRUARY 1997

## CPU (continued)

The 'x5x CPU architecture provides the following components:

- CPU registers:
  - A stack pointer that points to the last entry in the memory stack
  - A status register that monitors the operation of the instructions and contains the global-interrupt-enable bits
  - A program counter (PC) that points to the memory location of the next instruction to be executed
- A memory map that includes :
  - 256-, 512-, 1K-, 1.5K-, or 3.5K-byte general-purpose RAM that can be used for data-memory storage, program instructions, general-purpose register, or the stack (can be located only in the first 256 bytes)
  - A peripheral file that provides access to all internal peripheral modules, system-wide control functions, and EEPROM/EPROM programming control
  - 256- or 512-byte EEPROM module that provides in-circuit programmability and data retention in power-off conditions
  - 4K-, 8K-, 12K-, 16K-, 32K-, or 48K-byte ROM or 16K-, 32K-, or 48K-byte EPROM program memory

### stack pointer (SP)

The SP is an 8-bit CPU register. The stack operates as a last-in, first-out, read/write memory. Typically the stack is used to store the return address on subroutine calls as well as the status-register contents during interrupt sequences.

The SP points to the last entry or to the top of the stack. The SP increments automatically before data is pushed onto the stack and decrements after data is popped from the stack. The stack can be located only in the first 256 bytes of the on-chip RAM memory.

### status register (ST)

The ST monitors the operation of the instructions and contains the global-interrupt-enable bits. The ST includes four status bits (condition flags) and two interrupt-enable bits:

- The four status bits indicate the outcome of the previous instruction; conditional instructions (for example, the conditional-jump instructions) use these status bits to determine program flow.
- The two interrupt-enable bits control the two interrupt levels.

The ST register, status bit notation, and status bit definitions are shown in Table 4.

**Table 4. Status Registers**

7	6	5	4	3	2	1	0
C	N	Z	V	IE2	IE1	Reserved	Reserved
RW-0	RW-0	RW-0	RW-0	RW-0	RW-0		

R = read, W = write, 0 = value after reset

## CPU (continued)

### program counter (PC)

The contents of the PC point to the memory location of the next instruction to be executed. The PC consists of two 8-bit registers in the CPU: the program counter high (PCH) and program counter low (PCL). These registers contain the most-significant byte (MSbyte) and least-significant byte (LSbyte) of a 16-bit address.

The contents of the reset vector (7FFEh, 7FFFh) are loaded into the program counter during reset. The PCH (MSbyte of the PC) is loaded with the contents of memory location 7FFEh, and the PCL (LSbyte of the PC) is loaded with the contents of memory location 7FFFh. Figure 2 shows this operation using an example value of 6000h as the contents of memory locations 7FFEh and 7FFFh (reset vector).

Figure 2. Program Counter After Reset

### memory map

The TMS370Cx5x architecture is based on the Von Neuman architecture, where the program memory and data memory share a common address space. All peripheral input/output is memory mapped in this same common address space. In the expansion mode, external memory peripherals are also memory-mapped into this common address. As shown in Figure 3, the TMS370Cx5x provides a 16 bit-address range to access internal or external RAM, ROM, data EEPROM, EPROM input/output pins, peripheral functions, and system-interrupt vectors.

The peripheral file contains all input/output port control, on- and off-chip peripheral status and control, EPROM, EEPROM programming, and system-wide control functions. The peripheral file consists of 256 contiguous addresses located from 1000h to 10FFh. The 256 contiguous addresses are divided logically into 16 peripheral file frames of 16 bytes each. Each on-chip peripheral is assigned to a separate frame through which peripheral control and data information is passed. The TMS370Cx5x has its on-chip peripherals and system control assigned to peripheral file frames 1 through 7, addresses 1010h through 107Fh.

# TMS370Cx5x 8-BIT MICROCONTROLLER

SPNS010F – DECEMBER 1986 – REVISED FEBRUARY 1997

## memory map (continued)

† Reserved = the address space is reserved for future expansion.

‡ Not available (N/A) = address space unavailable in the mode illustrated.

§ Precoded chip select outputs available on external expansion bus.

¶ Microprocessor mode is designed for ROM-less devices ('x50 and 'x56). ROM and EPROM devices can also be used in this mode but all on-chip memory is ignored.

Figure 3. TMS370Cx5x Memory Map

## RAM/register file (RF)

Locations within RAM address space can serve as either register file or general-purpose read/write memory, program memory, or stack instructions. The TMS370Cx50 and TMS370Cx52 devices contain 256 bytes of internal RAM, mapped beginning at location 0000h and continuing through location 00FFh which is shown in Table 5 along with other 'x5x devices.

**Table 5. RAM Memory Map**

	'x50 and 'x52	'x56	'x58	'x53	'x59
RAM Size	256 Bytes	512 Bytes	1K Bytes	1.5K Bytes	3.5K Bytes
Memory Mapped	0000h – 00FFh	0000h – 01FFh	0000h – 03FFh	0000h – 05FFh	0000h – 0DFFh

The first 256 bytes of RAM (0000h – 00FFh) are register files, R0 through R255 (see Figure 1). The first two registers, R0 and R1, are also called register A and B, respectively. Some instructions implicitly use register A or B; for example, the instruction LDSP (load SP) assumes that the value to be loaded into the stack pointer is contained in register B. Registers A and B are the only registers cleared on reset.

## peripheral file (PF)

The TMS370Cx5x control registers contain all the registers necessary to operate the system and peripheral modules on the device. The instruction set includes some instructions that access the PF directly. These instructions designate the register by the number of the PF relative to 1000h, preceded by P0 for a hexadecimal designator or by P for a decimal designator. For example, the system control register 0 (SCCR0) is located at address 1010h; its peripheral file hexadecimal designator is P010, and its decimal designator is P16. Table 6 shows the TMS370Cx5x peripheral files.

**Table 6. TMS370Cx5x Peripheral File Address map**

ADDRESS RANGE	PERIPHERAL FILE DESIGNATOR	DESCRIPTION
1000h–100Fh	P000–P00F	Reserved for factory test

SPNS010F – DECEMBER 1986 – REVISED FEBRUARY 1997

## data EEPROM (continued)

Writing to the data EEPROM module is controlled by the data EEPROM control register (DEECTL) and the write-protection register (WPR). Programming algorithm examples are available in the *TMS370 Family User's Guide* (literature number SPNU127) or the *TMS370 Family Data Manual* (literature number SPNS014B). The data EEPROM features include the following:

- Programming:
  - Bit, byte, and block write/erase modes
  - Internal charge pump circuitry. No external EEPROM programming voltage supply is needed.
  - Control register: Data EEPROM programming is controlled by the data EEPROM control register (DEECTL) located in the PF frame beginning at location P01A.
  - In-circuit programming capability: There is no need to remove the device to program it.
- Write-protection: Writes to the data EEPROM are disabled during the following conditions:
  - Reset: All programming of the data EEPROM module is halted.
  - Write protection active: There is one write-protect bit per 32-byte EEPROM block.
  - Low-power mode operation
- Write protection can be overridden by applying 12 V to MC.

Table 8 shows the memory map of the control registers.

**Table 8. Data EEPROM and Program EPROM Control Registers Memory Map**

ADDRESS	SYMBOL	NAME
P014	EPCTLH	Program EPROM control register – high array
P015–P016		Reserved
P017	INT1	External interrupt 1 control register
P018	INT2	External interrupt 2 control register
P019	INT3	External interrupt 3 control register
P01A	DEECTL	Data EEPROM control register
P01B		Reserved
P01C	EPCTLM	Program EPROM control register – middle array
P01D		Reserved
P01E	EPCTLL	Program EPROM control register – low array

For the 16K-byte EPROM device, program memory is controlled by P01C; for the 32K-byte EPROM device, the program memory is controlled by P01C and P01E; for the 48K-byte EPROM device, the program memory is controlled by P014, P01C, and P01E.

## program EPROM

The '370C756 consists of a 16K-byte array of EPROM at address locations 4000h through 7FFFh. The '370C758 consists of 32K bytes made up of two 16K-byte arrays of EPROM; the first 16K-bytes array is located at address locations 2000h through 5FFFh, and the second 16K byte array is located at address locations 6000h through 9FFFh. The '370C759 consists of 48K bytes that is made up of three 16K byte arrays of EPROM; the first 16K bytes array is located at address locations 2000h through 5FFFh, the second 16K-byte array is located at address locations 6000h through 9FFFh, the third 16K-byte array is located at address locations A000h through DFFFh (see Figure 3).

## program EPROM (continued)

The EPROM memory map in Table 9 expresses the following:

- The programming control register for program EPROM (EPCTLM) for 16K-byte EPROM is located at address 101Ch (P01C).
- For the 32K-byte EPROM, the first 16K-byte array is controlled by EPCTLL, located at 101Eh (P01E); the second 16K-byte array is controlled by EPCTLM, located at 101Ch (P01C).
- For the 48K-byte EPROM, the first 16K-byte array is controlled by EPCTLL, located at 101Eh (P01E); the second 16K-byte array is controlled by EPCTLM, located at 101Ch (P01C); the third 16K-byte array is controlled by EPCTLH, located at 1014h (P014).

**Table 9. EPROM Memory Map**

	'756	'758		'759		
EPROM size	16K Bytes	32K Bytes		48K Bytes		
Memory Mapped	16K 4000h–7FFFh	First 16K 2000h–5FFFh	Second 16K 6000h–9FFFh	First 16K 2000h–5FFFh	Second 16K 6000h–9FFFh	Third 16K A000h–DFFFh
Control Registers	EPCTLM P01C	EPCTLL P01E	EPCTLM P01C	EPCTLL P01E	EPCTLM P01C	EPCTLH P014

Reading the program-EPROM modules is identical to reading other internal memory. During programming, the EPROM is controlled by the EPCTL. The program EPROM modules' features include:

- Programming
  - In-circuit programming capability if  $V_{PP}$  is applied to MC
  - Control register: Program EPROM programming is controlled by the program EPROM control registers (EPCTLL, EPCTLM, and EPCTLH) located in the PF frame as shown in Table 8.
  - Programming one EPROM module while executing the other
- Write protection: Writes to the program EPROM are disabled under the following conditions:
  - Reset: All programming to the EPROM module is halted.
  - Low-power modes
  - 13 V not applied to MC

## program ROM

The program ROM consists of 4K to 48K bytes of mask-programmable ROM. The program ROM is used for permanent storage of data or instructions. Programming of the mask ROM is performed at the time of device fabrication. ROM security is a feature of the '45x devices, which inhibits reading of the data using the programmer.

**Table 10. ROM Memory Map†**

	'x50	'x52	'x53	'x56	'x58	'x59
ROM Size	4K Bytes	8K Bytes	12K Bytes	16K Bytes	32K Bytes	48K Bytes
Memory Mapped	7000h – 7FFFh	6000h – 7FFFh	5000h – 7FFFh	4000h – 7FFFh	3000h – 9FFFh	2000h – DFFFh

† Memory addresses 7FE0h through 7FEBh are reserved for Texas Instruments (TI™), and addresses 7FECb through 7FFFh are reserved for interrupt and reset vectors. Trap vectors, used with TRAP0 through TRAP15 instructions are located between addresses 7FC0h and 7FDFh.

# TMS370Cx5x 8-BIT MICROCONTROLLER

SPNS010F – DECEMBER 1986 – REVISED FEBRUARY 1997

## system reset

The system-reset operation ensures an orderly start-up sequence for the TMS370Cx5x CPU-based device. There are up to three different actions that can cause a system reset to the device. Two of these actions are internally generated, while one ( $\overline{\text{RESET}}$ ) is controlled externally. These actions are as follows:

- Watchdog (WD) timer. A watchdog-generated reset occurs if an improper value is written to the WD key register, or if the re-initialization does not occur before the watchdog timer timeout. See the *TMS370 User's Guide* (literature number SPNU127) or the *TMS370 Family Data Manual* (literature number SPNS014B) for more information.
- Oscillator reset. Reset occurs when the oscillator operates outside the recommended operating range. See the *TMS370 User's Guide* (literature number SPNU127) or the *TMS370 Family Data Manual* (literature number SPNS014B) for more information.
- External  $\overline{\text{RESET}}$  Pin. A low-level signal can trigger an external reset. To ensure a reset, the external signal should be held low for one SYSCLK cycle. Signals of less than one SYSCLK can generate a reset. See the *TMS370 User's Guide* (literature number SPNU127) or the *TMS370 Family Data Manual* (literature number SPNS014B) for more information.

Once a reset source is activated, the external  $\overline{\text{RESET}}$  pin is driven (active) low for a minimum of eight SYSCLK cycles. This allows the 'x5x device to reset external system components. Additionally, if a cold-start condition ( $V_{CC}$  is off for several hundred milliseconds) occurs, oscillator failure occurs, or  $\overline{\text{RESET}}$  pin is held low, then the reset logic holds the device in a reset state for as long as these actions are active.

After a reset, the program can check the oscillator fault flag (OSC FLT FLAG, SCCR0.4), the cold start flag (COLD START, SCCR0.7), and the watchdog reset (WD OVRFL INT FLAG, T1CTL2.5) to determine the source of the reset. A reset does not clear these flags. Table 11 lists the reset sources.

**Table 11. Reset Sources**

REGISTER	ADDRESS	PF	BIT NO.	CONTROL BIT	SOURCE OF RESET
SCCR0	1010h	P010	7	COLD START	Cold (power-up)
SCCR0	1010h	P010	4	OSC FLT FLAG	Oscillator out of range
T1CTL2	104Ah	P04A	5	WD OVRFL INT FLAG	Watchdog timer timeout

Once a reset is activated, the following sequence of events occurs:

1. The CPU registers initialize: ST = 00h, SP = 01h (reset state).
2. Registers A and B initialize to 00h (no other RAM is changed).
3. The contents of the LSbyte of the reset vector (07FFh) are read and stored in the PCL.
4. The contents of the MSbyte of the reset vector (07FEh) are read and stored in the PCH.
5. Program execution begins with an opcode fetch from the address pointed to by the PC.

The reset sequence takes 20 SYSCLK cycles from the time the reset pulse is released until the first opcode fetch. During a reset, RAM contents (except for registers A and B) remain unchanged, and the module control register bits are initialized to their reset state. During  $\overline{\text{RESET}}$ , the two basic operating modes which are the microcomputer and microprocessor modes can be selected by applying the desired voltage level to the dedicated MC pin two cycles before  $\overline{\text{RESET}}$  goes inactive (refer to page 7 for operating modes description).

## interrupts

The TMS370 family software-programmable interrupt structure permits flexible on-chip and external interrupt configurations to meet real-time interrupt-driven application requirements. The hardware interrupt structure incorporates two priority levels as shown in Figure 4. Interrupt level 1 has a higher priority than interrupt level 2. The two priority levels can be masked independently by the global interrupt mask bits (IE1 and IE2) of the status register.

Each system interrupt is configured independently to either the high- or low-priority chain by the application program during system initialization. Within each interrupt chain, the interrupt priority is fixed by the position of the system interrupt. However, since each system interrupt is configured selectively on either the high- or low-priority interrupt chain, the application program can elevate any system interrupt to the highest priority. Arbitration between the two priority levels is performed within the CPU. Arbitration within each of the priority chains is performed within the peripheral modules to support interrupt expansion for future modules. Pending interrupts are serviced upon completion of current instruction execution, depending on their interrupt mask and priority conditions.

The TMS370Cx5x has nine hardware system interrupts (plus  $\overline{\text{RESET}}$ ) as shown in Table 12. Each system interrupt has a dedicated vector located in program memory through which control is passed to the interrupt service routines. A system interrupt can have multiple interrupt sources (e.g., SCI RXINT has two interrupt sources). All of the interrupt sources are individually maskable by local interrupt-enable control bits in the associated PF. Each interrupt source FLAG bit is individually readable for software polling or determining which interrupt source generated the associated system interrupt. Interrupt control block diagram is illustrated in Figure 4.

interrupts (continued)

Figure 4. Interrupt Control

On-chip peripheral functions generate six of the system interrupts. Three external interrupts also are supported. Software configuration of the external interrupts is performed through the INT1, INT2, and INT3 control registers in PF frame 1. Each external interrupt is individually software configurable for input polarity (rising or falling edge) for ease of system interface. External interrupt INT1 is software configurable as either a maskable or non-maskable interrupt. When INT1 is configured as nonmaskable, it cannot be masked by the individual- or global-enable mask bits. The INT1 NMI bit is protected during non-privileged operation and, therefore, should be configured during the initialization sequence following reset. To maximize pin flexibility, external interrupts INT2 and INT3 can be software configured as general purpose input/output pins if the interrupt function is not required (INT1 can be similarly configured as an input pin). Table 12 shows the interrupt vector sources, corresponding addresses, and hardware priorities.

interrupts (continued)

Table 12. Hardware System Interrupts

§ Releases microcontroller from STANDBY low-power mode.

privileged operation and EEPROM write-protection override

The TMS370Cx5x family has significant flexibility to enable the designer to software-configure the system and peripherals to meet the requirements of a broad variety of applications. The nonprivileged mode of operation ensures the integrity of the system configuration, once it is defined for an application. Following a hardware reset, the TMS370Cx5x operates in the privileged mode, where all peripheral file registers have unrestricted read/write access, and the application program configures the system during the initialization sequence following reset. As the last step of system initialization, the PRIVILEGE DISABLE bit (SCCR2.0) should be set to 1 to enter the nonprivileged mode; disabling write operations to specific configuration control bits within the peripheral file. Table 13 displays the system configuration bits that are write-protected during the nonprivileged mode and must be configured by software prior to exiting the privileged mode.

**privileged operation and EEPROM write-protection override (continued)**

**Table 13. Privileged Bits**

† The privileged bits are shown in a bold typeface in Table 15.

The write-protect override (WPO) mode provides an external hardware method for overriding the write-protection registers of data EEPROM on the TMS370Cx5x. The WPO mode is entered by applying a 12-V input to MC after  $\overline{\text{RESET}}$  input goes high (logic 1). The high voltage on MC during the WPO mode is not the programming voltage for the data EEPROM or Program EPROM. All EEPROM programming voltages are generated on-chip. The WPO mode provides hardware system-level capability to modify the content of the data EEPROM while the device remains in the application, but only while requiring a 12-V external input on the MC pin (normally not available in the end application except in a service or diagnostic environment).

**low-power and IDLE modes**

The TMS370Cx5x devices have two low-power modes (STANDBY and HALT) and an IDLE mode. For mask-ROM devices, low-power modes can be disabled permanently through a programmable contact at the time when the mask is manufactured.

The STANDBY and HALT low power modes significantly reduce power consumption by reducing or stopping the activity of the various on-chip peripherals when processing is not required. Each of the low-power modes is entered by executing the IDLE instruction when the PWRDWN/IDLE bit in SCCR2 has been set to 1. The HALT/STANDBY bit in SCCR2 controls which low-power mode is entered.

In the STANDBY mode (HALT/STANDBY = 0), all CPU activity and most peripheral module activity is stopped; however, the oscillator, internal clocks, timer 1, and the receive start-bit detection circuit of the serial communications interface remain active. System processing is suspended until a qualified interrupt (hardware  $\overline{\text{RESET}}$ , external interrupt on INT1, INT2, INT3, timer 1 interrupt, or low level on the receive pin of the serial communications interface 1) is detected.

### low-power and IDLE modes (continued)

In the HALT mode (HALT/STANDBY = 1), the TMS370Cx5x is placed in its lowest power consumption mode. The oscillator and internal clocks are stopped, causing all internal activity to be halted. System activity is suspended until a qualified interrupt (hardware RESET, external interrupt on the INT1, INT2, INT3, or low level on the receive pin of the serial communications interface 1) is detected. The low-power mode selection bits are summarized in Table 14.

**Table 14. Low-Power/Idle Control Bits**

POWER-DOWN CONTROL BITS		MODE SELECTED
PWRDWN/IDLE (SCCR2.6)	HALT/STANDBY (SCCR2.7)	
1	0	STANDBY
1	1	HALT
0	X	IDLE

X = don't care

When low-power modes are disabled through a programmable contact in the mask-ROM devices, writing to the SCCR2.6–7 bits is ignored. In addition, if an idle instruction is executed when low-power modes are disabled through a programmable contact, the device always enters the IDLE mode.

To provide a method of always exiting low-power modes for mask-ROM devices, INT1 is enabled automatically as a nonmaskable interrupt (NMI) during low-power modes when the hard watchdog mode is selected. This means that the NMI is generated always, regardless of the interrupt enable flags.

The following information is preserved throughout both the STANDBY and HALT modes: RAM (register file), CPU registers (stack pointer, program counter, and status register), I/O pin direction and output data, and status registers of all on-chip peripheral functions. Since all CPU instruction processing is stopped during the STANDBY and HALT modes, the clocking of the watchdog timer is inhibited.

### clock modules

The 'x5x family provides two clock options which are referred to as divide-by-1 (PLL) and divide-by-4 (standard oscillator). Both the divide-by-1 and divide-by-4 options are configurable during the manufacturing process of a TMS370 microcontroller. The 'x5x ROM-masked devices offer both options to meet system engineering requirements. Only one of the two clock options is allowed on each ROM device. The '75xA EPROM has only the standard divide-by-4, while the '75xB EPROM has the divide-by-1.

The divide-by-1 clock module option provides the capability for reduced electromagnetic interference (EMI) with no added cost.

The divide-by-1 provides a 1-to-1 match of the external resonator frequency to the internal system clock (SYSCLK) frequency. The divide-by-4 produces a SYSCLK which is one-fourth the frequency of the external resonator. Inside the divide-by-1 module, the frequency of the external resonator is multiplied by four. The clock module then divides the resulting signal by four to provide the four-phased internal system clock signals. The resulting SYSCLK is equal to the resonator frequency. The frequencies are formulated as follows

$$\text{Divide-by-4 option : SYSCLK} = \frac{\text{external resonator frequency}}{4} = \frac{\text{CLKIN}}{4}$$

$$\text{Divide-by-1 option : SYSCLK} = \frac{\text{external resonator frequency} \times 4}{4} = \text{CLKIN}$$

The main advantage of choosing a divide-by-1 oscillator is the improved EMI performance. The harmonics of low-speed resonators extend through less of the emissions spectrum than the harmonics of faster resonators. The divide-by-1 provides the capability of reducing the resonator speed by four times, and this results in a steeper decay of emissions produced by the oscillator.

### timer 1 module

The programmable timer 1 (T1) module of the TMS370Cx5x provides the designer with the enhanced timer resources required to perform realtime system control. The T1 module contains the general-purpose timer and the watchdog (WD) timer. The two independent 16-bit timers (T1 and WD) allow program selection of input clock sources (real-time, external event, or pulse-accumulate) with multiple 16-bit registers (input capture and compare) for special timer function control. The T1 module includes three external device pins that can be used for multiple counter functions (operation mode dependent) or used as general-purpose I/O pins. T1 module is shown in Figure 5.

timer 1 module (continued)

Figure 5. Timer 1 Block Diagram

- Three T1 I/O pins:
  - T1IC/CR: T1 input capture / counter reset input pin, or general-purpose bidirectional I/O pin
  - T1PWM: T1 pulse-width-modulation (PWM) output pin, or general-purpose bidirectional I/O pin
  - T1EVT: T1 event input pin, or general-purpose bidirectional I/O pin
- Two operation modes:
  - Dual-compare mode: Provides PWM signal
  - Capture/compare mode: Provides input capture pin
- One 16-bit general-purpose resettable counter
- One 16-bit compare register with associated compare logic
- One 16-bit capture/compare register, which, depending on the mode of operation, operates as either a capture or compare register
- One 16-bit WD counter can be used as an event counter, a pulse accumulator, or an interval timer if watchdog feature is not needed.
- Prescaler/clock sources that determine one of eight clock sources for general-purpose timer
- Selectable edge-detection circuitry that, depending on the mode of operation, senses active transitions on the input capture pins (T1IC/CR)

# TMS370Cx5x 8-BIT MICROCONTROLLER

SPNS010F – DECEMBER 1986 – REVISED FEBRUARY 1997

## timer 1 module (continued)

- Interrupts that can be generated on the occurrence of:
  - A capture
  - A compare equal
  - A counter overflow
  - An external edge detection
- Sixteen T1 module control registers located in the PF frame, beginning at address P040

Table 18 shows the T1 module control register.

† Once the WD OVRFL RST ENA bit is set, these bits cannot be changed until a reset; this applies only to the standard watchdog and to the simple counter. In the hard watchdog, these bits can be modified at any time; the WD INPUT SELECT2 bits are ignored.

timer 1 module (continued)

The T1 capture/compare mode block diagram is illustrated in Figure 6. The annotations on the diagram identify the register and the bit(s) in the peripheral frame. For example, the actual address of T1CTL2.0 is 104Ah, bit 0, in the T1CTL2 register.

Figure 6. Capture/Compare Mode

# TMS370Cx5x 8-BIT MICROCONTROLLER

SPNS010F – DECEMBER 1986 – REVISED FEBRUARY 1997

## timer 1 module (continued)

The T1 dual-compare mode block diagram is illustrated in Figure 7. The annotations on the diagram identify the register and the bit(s) in the peripheral frame. For example, the actual address of T1CTL2.0 is 104Ah, bit 0, in the T1CTL2 register.

Figure 7. Dual-Compare Mode

timer 1 module (continued)

The TMS370Cx5x device includes a 24-bit watchdog (WD) timer, contained in the T1 module, which can be software-programmed as an event counter, pulse accumulator, or interval timer if the watchdog function is not desired. The WD function is to monitor software and hardware operation and to implement a system reset when the WD counter is not serviced properly (WD counter overflow or WD counter is reinitialized by an incorrect value). The WD can be configured as one of the three mask options: standard watchdog, hard watchdog, or simple counter.

- Standard watchdog configuration (see Figure 8) – for 'C75xA EPROM and mask-ROM devices
  - Watchdog mode
    - Ten different WD overflow rates ranging from 6.55 ms to 3.35 s at 5-MHz SYSCCLK
    - A WD reset key (WDRST) register is used to clear the watchdog counter (WDCNTR) when a correct value is written.
    - Generates a system reset if an incorrect value is written to the watchdog reset key or if the counter overflows
    - A watchdog overflow flag (WD OVRFL INT FLAG) bit that indicates whether the WD timer initiated a system reset
  - Non-watchdog mode
    - Watchdog timer can be configured as an event counter, pulse accumulator, or an interval timer

Figure 8. Standard Watchdog

# TMS370Cx5x 8-BIT MICROCONTROLLER

SPNS010F – DECEMBER 1986 – REVISED FEBRUARY 1997

## timer 1 module (continued)

- Hard watchdog configuration (see Figure 9) – for 'C75xB EPROM and mask-ROM devices
  - Eight different WD overflow rates ranging from 26.2 ms to 3.35 s at 5-MHz SYSCLK.
  - A WD reset key (WDRST) register is used to clear the watchdog counter (WDCNTR) when a correct value is written.
  - Generates a system reset if an incorrect value is written to the watchdog reset key or if the counter overflows
  - Automatic activation of the WD timer upon power-up reset
  - INT1 is enabled as nonmaskable interrupt during low-power modes
  - A watchdog overflow flag (WD OVRFL INT FLAG) bit that indicates whether the WD timer initiated a system reset

Figure 9. Hard Watchdog

**timer 1 module (continued)**

- Simple-counter configuration (see Figure 10) – for mask-ROM devices only
  - The simple counter can be configured as an event counter, pulse accumulator, or an interval timer

**Figure 10. Simple Counter**

**timer 2A module**

The 16-bit general-purpose timer 2A (T2A) module is composed of a 16-bit resettable counter, 16-bit compare register with associated compare logic, 16-bit capture register, and a 16-bit register that functions as a capture register in one mode and as a compare register in the other mode. The T2A module adds an additional timer that provides an event count, input capture, and compare functions. The T2A module includes three external device pins that can be dedicated as timer functions or used as general-purpose I/O pins. The T2A module is shown in Figure 11.

timer 2A module (continued)

Figure 11. Timer 2A Block Diagram

The T2A module features include the following:

- Three T2A I/O pins:
  - T2AIC1/CR: T2A input-capture 1/counter-reset input pin, or general-purpose bidirectional I/O pin
  - T2AIC2/PWM: T2A input-capture 2/pulse-width-modulation (PWM) output pin, or general-purpose bidirectional I/O pin
  - T2AEVT: Timer 2A event-input pin, or general-purpose bidirectional I/O pin
- Two operational modes:
  - Dual-compare mode: Provides PWM signal
  - Dual-capture mode: Provides input-capture pin
- One 16-bit general-purpose resettable counter
- One 16-bit compare register with associated compare logic
- One 16-bit capture register with associated capture logic
- One 16-bit capture/compare register, which, depending on the mode of operation, operates as either a capture or compare register
- T2A clock sources can be any of the following:
  - System clock
  - No clock (the counter is stopped)
  - External clock synchronized to the system clock (event counter)
  - System clock while external input is high (pulse accumulation)

timer 2A module (continued)

- Selectable edge-detection circuitry that, depending on the mode of operation, senses active transitions on the input capture pins (T2AIC1/CR)
- Interrupts that can be generated on the occurrence of:
  - A compare equal to dedicated compare register
  - A compare equal to capture-compare register
  - A counter overflow
  - An external edge 1 detection
  - An external edge 2 detection
- Fourteen T2A module-control registers: Located in the PF frame beginning at address P060

The T2A module-control registers are illustrated in Table 19.

### serial peripheral interface (SPI) module

The SPI is a high-speed, synchronous, serial I/O port that allows a serial bit stream of programmed length (1 to 8 bits) to be shifted into, and out of, the device at a programmable bit-transfer rate. The SPI is used normally for communications between the microcontroller and external peripherals or another microcontroller. Typical applications include external I/O or peripheral expansion through devices such as shift registers, display drivers, and analog-to-digital converters. The master/slave operation of the SPI supports multi-device communications. The SPI module features include the following:

- Three external pins:
  - SPISOMI: SPI slave output/master input pin or general purpose bidirectional I/O pin
  - SPISIMO: SPI slave input/master output pin or general purpose bidirectional I/O pin
  - SPICLK: SPI serial clock pin or general purpose bidirectional I/O pin
- Two operational modes: master and slave
- Baud rate: Eight different programmable rates
  - Maximum baud rate in master mode: 2.5M bps at 5-MHz SYSCLK

$$\text{SPI BAUD RATE} = \frac{\text{SYSCLK}}{2 \times 2^b}$$

- Maximum baud rate in slave mode: 625K bps at 5-MHz SYSCLK.

For maximum slave SPI BAUD RATE < SYSCLK/8

where b = bit rate in SPICCR.5-3 (range 0–7)

- Data word format: one to eight data bits
- Simultaneous receive and transmit operation (transmit function can be disabled in software)
- Transmitter and receiver operations are accomplished through either interrupt driven or polled algorithms.
- Seven SPI module control registers located in control register frame beginning at address P030h

**serial peripheral interface (SPI) module (continued)**

The SPI module control registers are illustrated in Table 20.

**Table 20. SPI Module Control Register Memory Map**

## serial communications interface 1 (SCI1) module (continued)

Features of the SCI1 module include:

- Three external pins:
  - SCITXD: SCI transmit output pin or general-purpose bidirectional I/O pin
  - SCIRXD: SCI receive input pin or general-purpose bidirectional I/O pin
  - SCICLK: SCI bidirectional serial clock pin, or general-purpose bidirectional I/O pin

- Two communications modes: asynchronous and isosynchronous†

- Baud rate: 64K different programmable rates

- Asynchronous mode: 3 bps to 156K bps at 5-MHz SYSCLK

$$\text{ASYNCHRONOUS BAUD} = \frac{\text{SYSCLK}}{(\text{BAUD REG} + 1) \times 32}$$

- Isosynchronous mode: 39 bps to 2.5M bps at 5-MHz SYSCLK

$$\text{ISOSYNCHRONOUS BAUD} = \frac{\text{SYSCLK}}{(\text{BAUD REG} + 1) \times 2}$$

- Data-word format

- One start bit
- Data-word length programmable from 1 to 8 bits
- Optional even/odd/no parity bit
- One or two stop bits

- Four error-detection flags: parity, overrun, framing, and break detection

- Two wake-up multiprocessor modes: Idle-line and address bit

- Half or full-duplex operation

- Double-buffered receive and transmit functions

- Interrupt driven or polled algorithms with status flags accomplish transmitter (TX) and receiver (RX) operations.

- Transmitter: TXRDY flag (transmitter buffer register is ready to receive another character) and TX EMPTY flag (transmitter shift register is empty)
- Receiver: RXRDY flag (receive buffer register ready to receive another character), BRKDT flag (break condition occurred), and RX ERROR monitoring four interrupt conditions
- Separate enable bits for transmitter and receiver interrupts
- NRZ (non return-to-zero) format

- Eleven SCI1 module control registers are located in control register frame beginning at address P050h.

† Isosynchronous = Isochronous

analog-to-digital converter 1 (ADC1) module

The analog-to-digital converter 1 (ADC1) module is an 8-bit, successive approximation converter with internal sample-and-hold circuitry. The module has eight multiplexed analog input channels that allow the processor to convert the voltage levels from up to eight different sources. The ADC1 module features include the following:

- Minimum conversion time: 32.8  $\mu$ s at 5-MHz SYSCLK
- Ten external pins:
  - Eight analog input channels (AN0–AN7), any of which can be software configured as digital inputs (E0–E7) if not needed as analog channels
  - AN1–AN7 can also be configured as positive-input voltage reference.
  - $V_{CC3}$ : A/D module high-voltage reference input
  - $V_{SS3}$ : A/D module low-voltage reference input

## instruction set overview

Table 23 provides an opcode-to-instruction cross-reference of all 73 instructions and 274 opcodes of the '370Cx5x instruction set. The numbers at the top of this table represent the most significant nibble of the opcode while the numbers at the left side of the table represent the least significant nibble. The instruction of these two opcode nibbles contains the mnemonic, operands, and byte/cycle particular to that opcode.

For example, the opcode B5h points to the CLR A instruction. This instruction contains one byte and executes in eight SYSCLK cycles.

Legend:

- \* = Indirect addressing operand prefix
- & = Direct addressing operand prefix
- # = immediate operand
- #16 = immediate 16-bit number
- lab = 16-label
- n = immediate 8-bit number
- Pd = Peripheral register containing destination type
- Pn = Peripheral register
- Ps = Peripheral register containing source byte
- ra = Relative address
- Rd = Register containing destination type
- Rn = Register file
- Rp = Register pair
- Rpd = Destination register pair
- Rps = Source Register pair
- Rs = Register containing source byte

† All conditional jumps (opcodes 01-0F), BTJO, BTJZ, and DJNZ instructions use two additional cycles if the branch is taken. The BTJO, BTJZ, and DJNZ instructions have a relative address as the last operand.

---

## development system support

The TMS370 family development support tools include an assembler, a C compiler, a linker, an in-circuit emulator (XDS/22), CDT, and an EEPROM/UVEPROM programmer.

- Assembler/linker (Part No. TMDS3740850–02 for PC)
  - Includes extensive macro capability
  - Features high-speed operation
  - Includes format conversion utilities for popular formats
- ANSI C-Compiler (Part No. TMDS3740855–02 for PC, Part No. TMDS3740555–09 for HP700™, Sun-3™ or Sun-4™)
  - Generates assembly code for the TMS370 that can be inspected easily
  - Improves code execution speed and reduces code size with optional optimizer pass
  - Enables direct reference of the TMS370's port registers by using a naming convention
  - Provides flexibility in specifying the storage for data objects
  - Interfaces C functions and assembly functions easily
  - Includes assembler and linker
- CDT370 (compact development tool) real-time in-circuit emulation
  - Base (Part Number EDSCDT370 – for PC, requires cable)
    - Cable for 68-pin PLCC (Part No. EDSTRG68PLCC)
    - Cable for 64-pin SDIP (Part No. EDSTRG64SDIL)
  - Provides EEPROM and EPROM programming support
  - Allows inspection and modification of memory locations
  - Allows uploading/downloading of program and data memory
  - Provides capability to execute programs and software routines
  - Includes 1024 samples trace buffer
  - Includes single-step executable instructions
  - Allows use of software breakpoints to halt program execution at selected address
- XDS/22 (extended development support) in-circuit emulator
  - Base (Part Number TMDS3762210 for PC, requires cable)
  - Cable for 68-pin PLCC/64-Pin SDIP (Part No. TMDS3788868)
  - Contains all of the features of the CDT370 described above but does not have the capability to program the data EEPROM and program EPROM
  - Contains sophisticated breakpoint trace and timing hardware that provides up to 2047 qualified trace samples with symbolic disassembly
  - Allows breakpoints to be qualified by address and/or data on any type of memory acquisition. Up to four levels of events can be combined to cause a breakpoint
  - Provides timers for analyzing total and average time in routines

HP700 is a trademark of Hewlett-Packard Company.  
Sun-3 and Sun-4 are trademarks of Sun Microsystems, Inc.

# TMS370Cx5x 8-BIT MICROCONTROLLER

SPNS010F – DECEMBER 1986 – REVISED FEBRUARY 1997

---

## development system support (continued)

- Contains an eight-line logic probe for adding visibility of external signals to the breakpoint qualifier and for tracing display
- Microcontroller programmer
  - Base (Part No. TMDS3760500A – for PC, requires programmer head)
    - Single unit head for 68-pin PLCC (Part No. TMDS3780510A)
    - Single unit head for 64-pin SDIP (Part No. TMDS3780511A)
  - Personal computer-based, window/function-key oriented user interface for ease of use and rapid learning environment
- Design kit (Part No. TMDS3770110 – for PC)
  - Includes TMS370 Application Board and TMS370 Assembler diskette and documentation.
  - Supports quick evaluation of TMS370 functionality
  - Provides capability to upload and download code
  - Provides capability to execute programs and software routines, and to single-step executable instructions
  - Allows software breakpoints to halt program execution at selected addresses
  - Includes wire-wrap prototype area
  - Includes reverse assembler
- Starter Kit (Part No. TMDS37000 – For PC)
  - Includes TMS370 Assembler diskette and documentation
  - Includes TMS370 Simulator
  - Includes programming adapter board and programming software
  - Does not include – (to be supplied by the user):
    - + 5 V power supply
    - ZIF sockets
    - 9-pin RS232 cable

device numbering conventions

Figure 17 illustrates the numbering and symbol nomenclature for the TMS370Cx5x family.

Figure 17. TMS370Cx5x Family Nomenclature

# TMS370Cx5x 8-BIT MICROCONTROLLER

SPNS010F – DECEMBER 1986 – REVISED FEBRUARY 1997

## device part numbers

Table 24 provides a list of all the 'x5x devices available. The device part number nomenclature is designed to assist ordering. Upon ordering, the customer must specify not only the device part number but also the clock and watchdog timer options desired. Remember that each device can have only one of the three possible watchdog timer options and one of the two clock options. The options to be specified pertain solely to orders involving ROM devices.

**new code release form**

Figure 18 shows a sample of the new code release form.

NEW CODE RELEASE FORM  
TEXAS INSTRUMENTS  
TMS370 MICROCONTROLLER PRODUCTS

DATE: \_\_\_\_\_

To release a new customer algorithm to TI incorporated into a TMS370 family microcontroller, complete this form and submit with the following information:

1. A ROM description in object form on Floppy Disk, Modem XFR, or EPROM (Verification file will be returned via same media)
2. An attached specification if not using TI standard specification as incorporated in TI's applicable device data book.

Company Name: \_\_\_\_\_  
 Street Address: \_\_\_\_\_  
 Street Address: \_\_\_\_\_  
 City: \_\_\_\_\_ State \_\_\_\_\_ Zip \_\_\_\_\_

Contact Mr./Ms.: \_\_\_\_\_  
 Phone: (\_\_\_\_\_) \_\_\_\_\_ Ext.: \_\_\_\_\_

Customer Purchase Order Number: \_\_\_\_\_  
 Customer Print Number \*Yes: \_\_\_\_\_ # \_\_\_\_\_  
 No: \_\_\_\_\_ (Std. spec to be followed)

\*If Yes: Customer must provide "print" to TI w/NCRF for approval before ROM code processing starts.

Customer Part Number: \_\_\_\_\_  
 Customer Application: \_\_\_\_\_

TMS370 Device: \_\_\_\_\_  
 TI Customer ROM Number: \_\_\_\_\_  
 (provided by Texas Instruments)

OSCILLATOR FREQUENCY

	MIN	TYP	MAX

<input type="checkbox"/> Crystal	_____	_____	_____
<input type="checkbox"/> Ceramic Resonator	_____	_____	_____

Supply Voltage MIN: \_\_\_\_\_ MAX: \_\_\_\_\_  
 (std range: 4.5V to 5.5V)

TEMPERATURE RANGE

'L': 0° to 70°C (standard)  
 'A': -40° to 85°C  
 'T': -40° to 105°C

SYMBOLIZATION

TI standard symbolization  
 TI standard w/customer part number  
 Customer symbolization  
 (per attached spec, subject to approval)

NON-STANDARD SPECIFICATIONS:  
 ALL NON-STANDARDS SPECIFICATIONS MUST BE APPROVED BY THE TI ENGINEERING STAFF: If the customer requires expedited production material (i.e., product which must be started in process prior to prototype approval and full production release) and non-standard spec issues are not resolved to the satisfaction of both the customer and TI in time for a scheduled shipment, the specification parameters in question will be processed/tested to the standard TI spec. Any such devices which are shipped without conformance to a mutually approved spec, will be identified by a 'P' in the symbolization preceding the TI part number.

RELEASE AUTHORIZATION:  
 This document, including any referenced attachments, is and will be the controlling document for all orders placed for this TI custom device. Any changes must be in writing and mutually agreed to by both the customer and TI. The prototype cycletime commences when this document is signed off and the verification code is approved by the customer.

1. Customer: \_\_\_\_\_ Date: \_\_\_\_\_

2. TI: Field Sales: \_\_\_\_\_  
 Marketing: \_\_\_\_\_  
 Prod. Eng.: \_\_\_\_\_

# TMS370Cx5x 8-BIT MICROCONTROLLER

SPNS010F – DECEMBER 1986 – REVISED FEBRUARY 1997

## absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†

Supply voltage range, $V_{CC1}^{\ddagger}$ , $V_{CC2}$ , $V_{CC3}$ (see Note 2)	–0.6 V to 7 V
Input voltage range, All pins except MC	–0.6 V to 7 V
MC	–0.6 V to 14 V
Input clamp current, $I_{IK}$ ( $V_I < 0$ or $V_I > V_{CC1}$ )	±20 mA
Output clamp current, $I_{OK}$ ( $V_O < 0$ or $V_O > V_{CC1}$ )	±20 mA
Continuous output current per buffer, $I_O$ ( $V_O = 0$ to $V_{CC1}$ ) <sup>§</sup>	±10 mA
Maximum $I_{CC}$ current	170 mA
Maximum $I_{SS}$ current	–170 mA
Continuous power dissipation	1 W
Operating free-air temperature range, $T_A$ : L version	0°C to 70°C
A version	–40°C to 85°C
T version	–40°C to 105°C
Storage temperature range, $T_{stg}$	–65°C to 150°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

‡  $V_{CC1} = V_{CC}$

§ Electrical characteristics are specified with all output buffers loaded with specified  $I_O$  current. Exceeding the specified  $I_O$  current in any buffer can affect the levels on other buffers.

NOTE 2: Unless otherwise noted, all voltage values are with respect to  $V_{SS1}$ .

## recommended operating conditions

		MIN	NOM	MAX	UNIT	
$V_{CC1}$	Supply voltage (see Note 2)	4.5	5	5.5	V	
	RAM data-retention supply voltage (see Note 3)	3		5.5		
$V_{CC2}$	Digital I/O supply voltage (see Note 2)	4.5	5	5.5	V	
$V_{CC3}$	Analog supply voltage (see Note 2)	4.5	5	5.5	V	
$V_{SS2}$	Digital I/O supply ground	–0.3	0	0.3	V	
$V_{SS3}$	Analog supply ground	–0.3	0	0.3	V	
$V_{IL}$	Low-level input voltage	All pins except MC		0.8	V	
		MC, normal operation		0.3	V	
$V_{IH}$	High-level input voltage	All pins except MC, XTAL2/CLKIN, and RESET	2	$V_{CC1}$	V	
		MC (non-WPO mode)	$V_{CC1} - 0.3$	$V_{CC1} + 0.3$		
		XTAL2/CLKIN	$0.8 V_{CC1}$	$V_{CC1}$		
		RESET	$0.7 V_{CC1}$	$V_{CC1}$		
$V_{MC}$	MC (mode control) voltage (see Note 4)	EEPROM write protect override (WPO)	11.7	12	13	V
		EPROM programming voltage ( $V_{PP}$ )	13	13.2	13.5	
		Microprocessor	$V_{CC1} - 0.3$		$V_{CC1} + 0.3$	
		Microcomputer	$V_{SS1}$		0.3	
$T_A$	Operating free-air temperature	L version	0	70	°C	
		A version	–40	85		
		T version	–40	105		

NOTES: 2. Unless otherwise noted, all voltage values are with respect to  $V_{SS1}$ .

3. RESET must be externally activated when  $V_{CC1}$  or SYSClk is not within the recommended operating range.

4. The basic microcomputer and microprocessor operating modes are selected by the voltage level applied to the dedicated MC pin two system-clock cycles ( $t_C$ ) before RESET goes inactive (high). The WPO mode can be selected anytime a sufficient voltage is present on MC.

## electrical characteristics over recommended operating free-air temperature range (unless

otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT	
V <sub>OL</sub>	Low-level output voltage (see Note 5)	I <sub>OL</sub> = 1.4 mA				0.4	V

		SYSCLK = 3 MHz,		See Notes 7 and 8		8	11	
SYSCLK = 0.5 MHz,		See Notes 7 and 8		2.5	3.5			
Supply current (STANDBY mode) OSC POWER bit = 1 (see Note 11)	SYSCLK = 3 MHz,		See Notes 7 and 8		6	8.6	mA	
	SYSCLK = 0.5 MHz,		See Notes 7 and 8		2	3		
Supply current (HALT mode)	XTAL2/CLKIN < 0.2 V,		See Note 7		2	30	μA	

† TMS370Cx59 only operate up to 3 MHz SYSCLK

- NOTES:
- In prior versions of the TMS370 family, the I<sub>OL</sub> current was equal to 2 mA for ports A, B, C, and D and the RESET pin.
  - Input current I<sub>pp</sub> is a maximum of 50 mA only when the EPROM is being programmed.
  - Single chip mode, ports configured as inputs or outputs with no load. All inputs ≤ 0.2 V or ≥ V<sub>CC</sub> - 0.2V.
  - XTAL2/CLKIN is driven with an external square wave signal with 50% duty cycle and rise and fall times less than 10 ns. Current can be higher with a crystal oscillator. At 5 MHz SYSCLK, this extra current = 0.01 mA x (total load capacitance + crystal capacitance in pF).
  - Maximum operating current for TMS370Cx50A and TMS370Cx52A = 7.6 (SYSCLK) + 7 mA. Maximum operating current for TMS370Cx53A, TMS370Cx56A, TMS370Cx58A, and TMS370Cx58B = 10 (SYSCLK) + 5.8 mA.
  - Maximum standby current for TMS370Cx5xA = 3 (SYSCLK) + 2 mA. (OSC POWER bit = 0).
  - Maximum standby current for TMS370Cx5xA and TMS370Cx5xB = 2.24 (SYSCLK) + 1.9 mA. (OSC POWER bit = 1, valid only up to 3 MHz of SYSCLK.)

PARAMETER MEASUREMENT INFORMATION

NOTES: A. The crystal/ceramic resonator frequency is four times the reciprocal of the system clock period.  
B. The values of C1 and C2 are typically 15 pF and C3 is typically 50 pF. See the manufacturer's recommendations for ceramic resonators.

Figure 19. Recommended Crystal/Clock Connections

Case 1:  $V_O = V_{OH} = 2.4\text{ V}$ ; Load Voltage = 0 V  
Case 2:  $V_O = V_{OL} = 0.4\text{ V}$ ; Load Voltage = 2.1 V

NOTE A: All measurements are made with the pin loading as shown unless otherwise noted. All measurements are made with XTAL2/CLKIN driven by an external square wave signal with a 50% duty cycle and rise and fall times less than 10 ns unless otherwise stated.

Figure 20. Typical Output Load Circuit (see Note A)

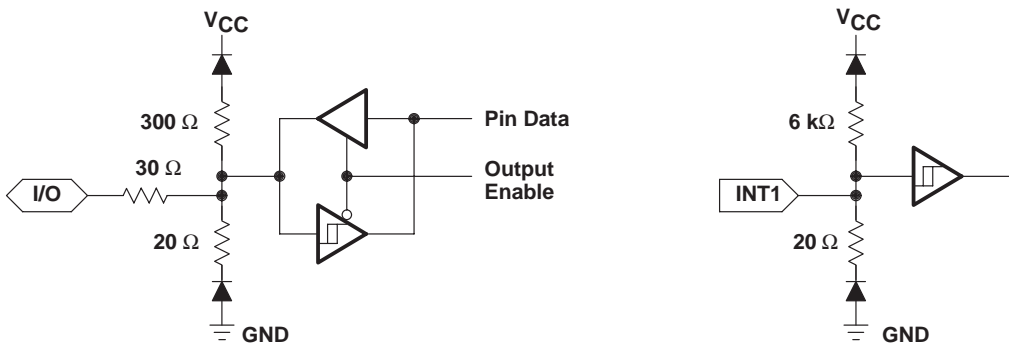

Figure 21. Typical Buffer Circuitry

## PARAMETER MEASUREMENT INFORMATION

### timing parameter symbology

Timing parameter symbols have been created in accordance with JEDEC Standard 100. In order to shorten the symbols, some of the pin names and other related terminology have been abbreviated as follows:

A	Address	RXD	SCIRXD
AR	Array	S	Slave mode
B	Byte	SC	SYSCLK
CI	XTAL2/CLKIN	SCC	SCICLK
D	Data	SIMO	SPISIMO
E	$\overline{\text{EDS}}$	SOMI	SPISOMI
FE	Final	SPC	SPICLK
IE	Initial	TXD	SCITXD
M	Master mode	W	Write
PGM	Program	WT	$\overline{\text{WAIT}}$
R	Read		

Lowercase subscripts and their meanings are:

c	cycle time (period)	r	rise time
d	delay time	su	setup time
f	fall time	v	valid time
h	hold time	w	pulse duration (width)

The following additional letters are defined as follows:

H	High
L	Low
V	Valid
Z	High impedance

All timings are measured between high and low measurement points as indicated in Figure 22 and Figure 23.

Figure 22. XTAL2/CLKIN Measurement Points

Figure 23. General Measurement Points

# TMS370Cx5x 8-BIT MICROCONTROLLER

SPNS010F – DECEMBER 1986 – REVISED FEBRUARY 1997

## external clocking requirements for clock divided by 4†

NO.	PARAMETER	MIN	MAX	UNIT
1	$t_w(\text{Cl})$ Pulse duration, XTAL2/CLKIN (see Note 12)	20		ns
2	$t_r(\text{Cl})$ Rise time, XTAL2/CLKIN		30	ns
3	$t_f(\text{Cl})$ Fall time, XTAL2/CLKIN		30	ns
4	$t_d(\text{ClH-SCL})$ Delay time, XTAL2/CLKIN rise to SYSCLK fall		100	ns
	CLKIN‡ Crystal operating frequency	2	20	MHz
	SYSCLK§ System clock¶	0.5	5	MHz

† For  $V_{IL}$  and  $V_{IH}$ , refer to recommended operating conditions.

‡ x59A operates up to 12 MHz CLKIN

§ x59A operates up to 3 MHz SYSCLK

¶ SYSCLK = CLKIN/4

NOTE 12: This pulse can be either a high pulse which extends from the earliest valid high to the final valid high in an XTAL2/CLKIN cycle, or a low pulse, which extends from the earliest valid low to the final valid low in an XTAL2/CLKIN cycle.

Figure 24. External Clock Timing for Divide-by-4

## external clocking requirements for clock divided by 1 (PLL)†

NO.	PARAMETER	MIN	MAX	UNIT
1	$t_w(\text{Cl})$ Pulse duration, XTAL2/CLKIN (see Note 12)	20		ns
2	$t_r(\text{Cl})$ Rise time, XTAL2/CLKIN		30	ns
3	$t_f(\text{Cl})$ Fall time, XTAL2/CLKIN		30	ns
4	$t_d(\text{ClH-SCH})$ Delay time, XTAL2/CLKIN rise to SYSCLK rise		100	ns
	CLKIN# Crystal operating frequency	2	5	MHz
	SYSCLK§ System clock	2	5	MHz

† For  $V_{IL}$  and  $V_{IH}$ , refer to recommended operating conditions.

§ x59A operates up to 3 MHz SYSCLK

# x59A operates up to 3 MHz CLKIN (for divide-by-1 clock option)

|| SYSCLK = CLKIN/1

NOTE 12: This pulse can be either a high pulse which extends from the earliest valid high to the final valid high in an XTAL2/CLKIN cycle, or a low pulse, which extends from the earliest valid low to the final valid low in an XTAL2/CLKIN cycle.

Figure 25. External Clock Timing for Divide-by-1

**general purpose output signal-switching time requirements**

	MIN	NOM	MAX	UNIT
$t_r$ Rise time		30		ns
$t_f$ Fall time		30		ns

Figure 26. Signal-Switching Timing

**recommended EEPROM timing requirements for programming**

	MIN	MAX	UNIT
$t_w(\text{PGM})_B$ Pulse duration, programming signal to ensure valid data is stored (byte mode)	10		ms
$t_w(\text{PGM})_{AR}$ Pulse duration, programming signal to ensure valid data is stored (array mode)	20		ms

**recommended EPROM operating conditions for programming**

	MIN	NOM	MAX	UNIT
$V_{CC1}$ Supply voltage	4.75	5.5	6	V

7	$t_w(\text{SCH})$	Pulse duration, SYSCLK high	$0.5t_c$	$0.5t_c + 20$	ns	
8	$t_d(\text{SCL-A})$	Delay time, SYSCLK low to address $R/\overline{W}$ and $\overline{OCF}$ valid		$0.25t_c + 75$	ns	
9	$t_v(\text{A})$	Valid time, address to $\overline{\text{EDS}}$ , $\overline{\text{CSE1}}$ , $\overline{\text{CSE2}}$ , $\overline{\text{CSH1}}$ , $\overline{\text{CSH2}}$ , $\overline{\text{CSH3}}$ , and $\overline{\text{CSPF}}$ low	$0.5t_c - 90$		ns	
10	$t_{su}(\text{D})$	Setup time, write data time to $\overline{\text{EDS}}$ high	$0.75t_c - 80^\ddagger$		ns	
11	$t_h(\text{EH-A})$	Hold time, address, $R/\overline{W}$ and $\overline{OCF}$ from $\overline{\text{EDS}}$ , $\overline{\text{CSE1}}$ , $\overline{\text{CSE2}}$ , $\overline{\text{CSH1}}$ , $\overline{\text{CSH2}}$ , $\overline{\text{CSH3}}$ , and $\overline{\text{CSPF}}$ high	$0.5t_c - 60$		ns	
12	$t_h(\text{EH-D})\text{W}$	Hold time, write data time from $\overline{\text{EDS}}$ high	$0.75t_c + 15$		ns	
13	$t_d(\text{DZ-EL})$	Delay time, data bus high impedance to $\overline{\text{EDS}}$ low (read cycle)	$0.25t_c - 35$		ns	
14	$t_d(\text{EH-D})$	Delay time, $\overline{\text{EDS}}$ high to data bus enable (read cycle)	$1.25t_c - 40$		ns	
15	$t_d(\text{EL-DV})\text{R}$	Delay time, $\overline{\text{EDS}}$ low to read data valid		$t_c - 95^\ddagger$	ns	
16	$t_h(\text{EH-D})\text{R}$	Hold time, read time from $\overline{\text{EDS}}$ high	0		ns	
17	$t_{su}(\text{WT-SCH})$	Setup time, $\overline{\text{WAIT}}$ time to SYSCLK high	$0.25t_c + 70^\S$		ns	
18	$t_h(\text{SCH-WT})$	Hold time, $\overline{\text{WAIT}}$ time from SYSCLK high	0		ns	
19	$t_d(\text{EL-WTV})$	Delay time, $\overline{\text{EDS}}$ low to $\overline{\text{WAIT}}$ valid		$0.5t_c - 60$	ns	
20	$t_w$	Pulse duration, $\overline{\text{EDS}}$ , $\overline{\text{CSE1}}$ , $\overline{\text{CSE2}}$ , $\overline{\text{CSH1}}$ , $\overline{\text{CSH2}}$ , $\overline{\text{CSH3}}$ , and $\overline{\text{CSPF}}$ low	$t_c - 80^\ddagger$	$t_c + 40^\ddagger$	ns	
21	$t_d(\text{AV-DV})\text{R}$	Delay time, address valid to read data valid		$1.5t_c - 115^\ddagger$	ns	
22	$t_d(\text{AV-WTV})$	Delay time, address valid to $\overline{\text{WAIT}}$ valid		$t_c - 115$	ns	
23	$t_d(\text{AV-EH})$	Delay time, address valid to $\overline{\text{EDS}}$ high (end of write)	$1.5t_c - 85^\ddagger$		ns	

†  $t_c$  = system-clock cycle time =  $1/\text{SYSCLK}$

‡ If wait states, PFWait, or the autowait feature is used, add  $t_c$  to this value for each wait state invoked.

§ If the autowait feature is enabled, the  $\overline{\text{WAIT}}$  input can assume a "don't care" condition until the third cycle of the access. The  $\overline{\text{WAIT}}$  signal must be synchronized with the high pulse of the SYSCLK signal while still conforming to the minimum setup time.

# TMS370Cx5x 8-BIT MICROCONTROLLER

SPNS010F – DECEMBER 1986 – REVISED FEBRUARY 1997

## SPI slave mode external timing characteristics and requirements (see Note 14 and Figure 32)

NO.		MIN	MAX	UNIT
45	$t_c(\text{SPC})S$ Cycle time, SPICLK	$8t_c$		ns
46	$t_w(\text{SPCL})S$ Pulse duration, SPICLK low	$4t_c - 45$	$0.5t_c(\text{SPC})S + 45$	ns
47	$t_w(\text{SPCH})S$ Pulse duration, SPICLK high	$4t_c - 45$	$0.5t_c(\text{SPC})S + 45$	ns
48	$t_d(\text{SPCL-SOMIV})S$ Delay time, SPISOMI valid after SPICLK low (polarity = 1)		$3.25t_c + 130$	ns
49	$t_v(\text{SPCH-SOMI})S$ Valid time, SPISOMI data valid after SPICLK high (polarity = 1)	$t_w(\text{SPCH})S$		ns
50	$t_{su}(\text{SIMO-SPCH})S$ Setup time, SPISIMO to SPICLK high (polarity = 1)	0		ns
51	$t_v(\text{SPCH-SIMO})S$ Valid time, SPISIMO data after SPICLK high (polarity = 1)	$3t_c + 100$		ns

NOTE 14:  $t_c$  = system-clock cycle time = 1 / SYSCLK

NOTE A: The diagram shows polarity = 1. SPICLK is inverted when polarity = 0.

Figure 32. SPI-Slave External Timing

The ADC1 has a separate power bus for its analog circuitry. These pins are referred to as  $V_{CC3}$  and  $V_{SS3}$ . The purpose is to enhance ADC1 performance by preventing digital switching noise of the logic circuitry that can be present on  $V_{SS1}$  and  $V_{CC1}$  from coupling into the ADC1 analog stage. All ADC1 specifications are given with respect to  $V_{SS3}$  unless otherwise noted.

Resolution ..... 8-bits (256 values)  
 Monotonic ..... Yes  
 Output conversion mode ..... 00h to FFh (00 for  $V_I \leq V_{SS3} \leq$ ; FF for  $V_I \leq V_{ref}$ )  
 Conversion time (excluding sample time) .....  $164 t_c$

**recommended operating conditions**

	MIN	NOM	MAX	UNIT
$V_{CC3}$ Analog supply voltage	4.5	5	5.5	V
	$V_{CC1}-0.3$		$V_{CC1}+0.3$	
$V_{SS3}$ Analog ground	$V_{SS1}-0.3$		$V_{SS1}+0.3$	V
$V_{ref}$ Non- $V_{CC3}$ reference†	2.5	$V_{CC3}$	$V_{CC3} + 0.1$	V
Analog input for conversion	$V_{SS3}$		$V_{ref}$	V

†  $V_{ref}$  must be stable, within  $\pm 1/2$  LSB of the required resolution, during the entire conversion time.

**operating characteristics over recommended ranges operating conditions**

PARAMETER		MIN	MAX	UNIT	
Absolute accuracy‡		$V_{CC3} = 5.5$ V	$V_{ref} = 5.1$ V	$\pm 1.5$	LSB
Differential/integral linearity error‡§		$V_{CC3} = 5.5$ V	$V_{ref} = 5.1$ V	$\pm 0.9$	LSB
$I_{CC3}$ Analog supply current	Converting		2	mA	
	Nonconverting		5	$\mu$ A	
$I_I$	Input current, AN0–AN7	$0$ V $\leq V_I \leq 5.5$ V		2	$\mu$ A
	$I_{ref}$ input charge current		1	mA	
$Z_{ref}$ Source impedance of $V_{ref}$		SYSCLK $\leq 3$ MHz		24	k $\Omega$
		$3$ MHz $<$ SYSCLK $\leq 5$ MHz		10	k $\Omega$

‡ Absolute resolution = 20 mV. At  $V_{ref} = 5$  V, this is one LSB. As  $V_{ref}$  decreases, LSB size decreases; therefore, the absolute accuracy and differential/integral linearity errors in terms of LSBs increase.

§ Excluding quantization error of 1/2 LSB

# TMS370Cx5x 8-BIT MICROCONTROLLER

SPNS010F – DECEMBER 1986 – REVISED FEBRUARY 1997

The ADC1 module allows complete freedom in design of the sources for the analog inputs. The period of the sample time is user-defined so that the high-impedance can be accommodated without penalty to the low-impedance sources. The sample period begins when the SAMPLE START bit of the ADC1 control register (ADCTL.6) is set to 1. The end of the signal sample period occurs when the conversion bit (CONVERT START, ADCTL.7) is set to 1. After a hold time, the converter will reset the SAMPLE START and CONVERT START bits, signaling that a conversion has started and that the analog signal can be removed.

## analog timing requirements

		MIN	MAX	UNIT
$t_{su(S)}$	Setup time, analog to sample command	0		ns
$t_{h(AN)}$	Hold time, analog input from start of conversion	$18t_c$		ns
$t_w(S)$	Pulse duration, sample time per kilohm of source impedance†	1		$\mu s/k\Omega$

† The value given is valid for a signal with a source impedance > 1 k $\Omega$ . If the source impedance is < 1 k $\Omega$ , use a minimum sampling time of 1 $\mu s$ .

Figure 33. Analog Timing

Table 26 is designed to aid the user in referencing a device part number to a mechanical drawing. The table shows a cross-reference of the device part number to the TMS370 generic package name and the associated mechanical drawing by drawing number and name.

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
