

1-A DC Motor Driver for Servo Driver Applications

TLE 4206

Overview

Features

- Optimized for headlight beam control applications
- Current-peak-blanking (no electrolytic capacitor at V_S)
- Delivers up to 0.8 A continuous
- Low saturation voltage; typ. 1.2 V total @ 25 °C; 0.4 A
- Output protected against short circuit
- Overtemperature protection with hysteresis
- Over- and undervoltage lockout
- No crossover current
- Internal clamp diodes
- Enhanced power packages

Description

The TLE 4206 is a fully protected H-Bridge Driver designed specifically for automotive headlight beam control and industrial servo control applications.

The part is built using the Siemens bipolar high voltage power technology DOPL.

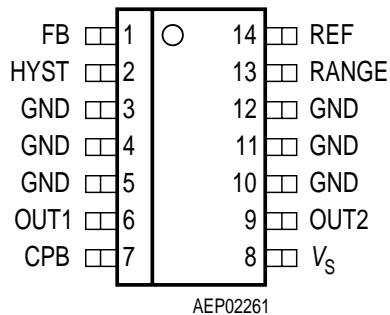

The standard enhanced power P-DSO-14 package meets the application requirements and saves PCB-board space and costs.

The servo-loop-parameter pos.- and neg. Hysteresis, pos.- and neg. deadband and angle-amplification are programmable with external resistors.

An internal window-comparator controls the input line. In the case of a fault condition, like short circuit to GND, short circuit to supply-voltage, and broken wire, the TLE 4206 stops the motor immediately (brake condition).

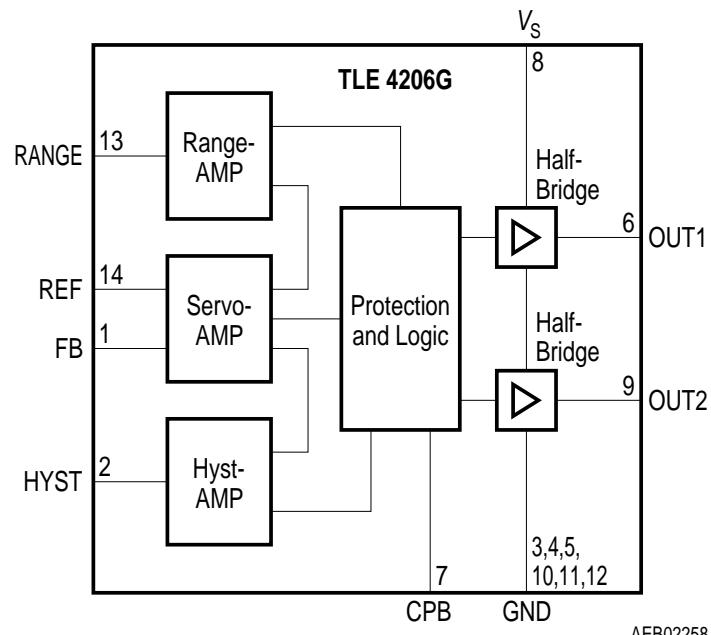

The “programable current-peak-blanking” disables the servo-loop during the V_S voltage drop caused by the stall current spike. So there is no need of an electrolytic blocking capacitor at the V_S -terminal.

Furthermore the built in features like over- and undervoltage-lockout, short-circuit-protection and over-temperature-protection will open a wide range of automotive- and industrial applications.
