

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

DESCRIPTION (CONTINUED)

Compared to the TPS65160 and TPS65160A the TPS65161/A/B family of devices offer increased step-down converter output current. The TPS65161B also offers increased charge pump output current, and a higher undervoltage lockout threshold. The devices can be powered from a 12-V input supply and generate the four main supply voltages required by TFT LCD display panels.

Each device comprises a boost converter to generate the source voltage V_S , a step-down converter to generate the logic supply $V_{(LOGIC)}$, and regulated positive and negative charge pumps to generate the TFT bias voltages V_{GH} and V_{GL} . Both switching converters and both charge pumps operate from a central clock that can be set to either 750-kHz or 500-kHz by tying the $FREQ$ pin high or low.

The TPS65161/A/B devices feature adjustable power supply sequencing, plus a number of safety features such as boost converter overvoltage protection, buck converter short-circuit protection, and thermal shutdown. The devices also incorporate a gate drive signal to control an external MOSFET isolation switch connected in series with V_S or V_{GH} (see the application section at the end of this data sheet for more information).

ORDERING INFORMATION ⁽¹⁾

T_A	BOOST SWITCH CURRENT LIMIT $I_{LIM}(min)$	CHARGE PUMP CURRENT LIMIT ⁽²⁾	UVLO THRESHOLD	ORDERING	PACKAGE ⁽³⁾	PACKAGE MARKING
-40°C to 85°C	2.8A	100mA	6V	TPS65161PWP	HTSSOP28 (PWP)	TPS65161
	3.7A	100mA	6V	TPS65161APWP	HTSSOP28 (PWP)	TPS65161A
	3.7A	200mA	8V	TPS65161BPWP	HTSSOP28 (PWP)	TPS65161B

- (1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI Web site at www.ti.com.
- (2) Because of the charge pumps' 50% duty cycle, the maximum current available from V_{GH} and V_{GL} in typical applications is equal to approximately half the charge pump current limit.
- (3) The PWP package is available taped and reeled. Add R-suffix to the device type (TPS65161PWPR) to order the device taped and reeled. The TPS65161PWPR package has quantities of 2000 devices per reel. Without suffix, the TPS65161PWP is shipped in tubes with 50 devices per tube.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

	UNIT
Voltages on pin VIN ⁽²⁾	-0.3 V to 16.5 V
Voltages on pin $EN1$, $EN2$, $FREQ$ ⁽²⁾	-0.3 V to 16.5 V
Voltage on pin SW ⁽²⁾	25 V
Voltage on pin SWB ⁽²⁾	20 V
Voltages on pin OS , SUP , GD ⁽²⁾	25 V
Continuous power dissipation	See Dissipation Rating Table
T_A Operating junction temperature	-40°C to 150°C
T_{stg} Storage temperature range	-65°C to 150°C

- (1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground terminal.

DISSIPATION RATINGS

PACKAGE	RTH _{JA}	T _A ≤ 25°C POWER RATING	T _A = 70°C POWER RATING	T _A = 85°C POWER RATING
28-Pin HTSSOP	28°C/W (PowerPAD ⁽¹⁾ soldered)	3.57 W	1.96 W	1.42 W

(1) See Texas Instruments application report [SLMA002](#) regarding thermal characteristics of the PowerPAD package.

RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _S	Output voltage range of the main boost converter ⁽¹⁾			19	V
C _{IN}	Input capacitor at VINB		2x22		μF
	Input capacitor AVIN		1		μF
L	Inductor boost converter ⁽²⁾		10		μH
	Inductor buck converter ⁽²⁾		15		
V _(LOGIC)	Output voltage range of the step-down converter V _(LOGIC)	1.8		5.0	V

NOTE: The thermally enhanced PowerPAD™ is connected to PGND.

TERMINAL FUNCTIONS

TERMINAL		I/O	DESCRIPTION
NAME	NO.		
SUP	8	I	This is the supply pin of the positive charge pump driver and can be connected to the input supply V_{IN} or the output of the main boost converter V_S . This depends mainly on the desired output voltage V_{GH} and numbers of charge pump stages.
FREQ	12	I	Frequency adjust pin. This pin allows setting the switching frequency with a logic level to 500 kHz = low and 750 kHz = high.
AVIN	22	I	Analog input voltage of the device. This is the input for the analog circuits of the device and should be bypassed with a 1- μ F ceramic capacitor for good filtering.
VINB	20, 21	I	Power input voltage pin for the buck converter.
EN1	16	I	This is the enable pin of the buck converter and negative charge pump. When this pin is pulled high, the buck converter starts up, and after a delay time set by DLY1, the negative charge pump comes up. This pin must be terminated and not be left floating. A logic high enables the device and a logic low shuts down the device.
EN2	9	I	The boost converter starts only with EN1 = high, after the step-down converter is enabled. EN2 is the enable pin of the boost converter and positive charge pump. When this pin is pulled high, the boost converter and positive charge pump starts up after the buck converter is within regulation and a delay time set by DLY2 has passed by. This pin must be terminated and not be left floating. A logic high enables the device and a logic low shuts down the device.
DRN	11	O	Drive pin of the negative charge pump.
FBN	13	I	Feedback pin of negative charge pump.
REF	24	O	Internal reference output typically 1.213 V. A 220-nF capacitor needs to be connected to this pin.
PGND	6, 7		Power ground
SS	28	O	This pin allows setting the soft-start time for the main boost converter V_S . Typically a 22-nF capacitor needs to be connected to this pin to set the soft-start time.
DLY1	25	O	Connecting a capacitor from this pin to GND allows the setting of the delay time between $V_{(LOGIC)}$ (step-down converter output high) to V_{GL} during start-up.
DLY2	26	O	Connecting a capacitor from this pin to GND allows the setting of the delay time between $V_{(LOGIC)}$ (step-down converter output high) to V_S boost converter and positive charge-pump V_{GH} during start-up.
COMP	2		This is the compensation pin for the main boost converter. A small capacitor and, if required, a resistor is connected to this pin.
FBB	15	I	Feedback pin of the buck converter
SWB	18	O	Switch pin of the buck converter
NC	19		Not connected
BOOT	17	I	N-channel MOSFET gate drive voltage for the buck converter. Connect a capacitor from the switch node SWB to this pin.
FBP	14	I	Feedback pin of positive charge pump.
DRP	10	O	Drive pin of the positive charge pump.
GD	27		This is the gate drive pin which can be used to control an external MOSFET switch to provide input to output isolation of V_S or V_{GH} . See the circuit diagrams at the end of this data sheet. GD is an open-drain output and is latched low as soon as the boost converter is within 8% of its nominal regulated output voltage. GD goes high impedance when the EN2 input voltage is cycled low.
GND	23		Analog ground
OS	3	I	Output sense pin. The OS pin is connected to the internal rectifier switch and overvoltage protection comparator. This pin needs to be connected to the output of the boost converter and cannot be connected to any other voltage rail. Connect a 470-nF capacitor from OS pin to GND to avoid noise coupling into this pin. The PCB trace of the OS pin needs to be wide because it conducts high current.
FB	1	I	Feedback of the main boost converter generating V_{source} (V_S).
SW	4, 5	I	Switch pin of the boost converter generating V_{source} (V_S).
PowerPAD			The PowerPAD needs to be connected and soldered to power ground (PGND).

FUNCTIONAL BLOCK DIAGRAM

DETAILED DESCRIPTION

Boost Converter

The main boost converter operates in pulse-width modulation (PWM) and at a fixed switching frequency of 500 kHz or 750 kHz set by the **FREQ** pin. The converter uses an unique fast response, voltage-mode controller scheme with input voltage feedforward. This achieves excellent line and load regulation (0.03%-A load regulation typical) and allows the use of small external components. To add higher flexibility to the selection of external component values, the device uses external loop compensation. Although the boost converter looks like a nonsynchronous boost converter topology operating in discontinuous conduction mode at light load, the TPS65161 maintains continuous conduction even at light-load currents. This is achieved with a novel architecture using an external Schottky diode with an integrated MOSFET in parallel connected between **SW** and **OS**. See the Functional Block Diagram. The intention of this MOSFET is to allow the current to go negative that occurs at light-load conditions. For this purpose, a small integrated P-Channel MOSFET with typically 10- Ω $r_{DS(on)}$ is sufficient. When the inductor current is positive, the external Schottky diode with the lower forward voltage conducts the current. This causes the converter to operate with a fixed frequency in continuous conduction mode over the entire load current range. This avoids the ringing on the switch pin as seen with standard nonsynchronous boost converter and allows a simpler compensation for the boost converter.

Soft Start (Boost Converter)

The main boost converter has an adjustable soft start to prevent high inrush current during start-up. The soft-start time is set by the external capacitor connected to the **SS** pin. The capacitor connected to the **SS** pin is charged with a constant current that increases the voltage on the **SS** pin. The internal current limit is proportional to the voltage on the soft-start pin. When the threshold voltage of the internal soft-start comparator is reached, the full current limit is released. The larger the soft-start capacitor value, the longer the soft-start time.

Overvoltage Protection of the Boost Converter

The main boost converter has an overvoltage protection to protect the main switch Q2 at pin (**SW**) in case the feedback (**FB**) pin is floating or shorted to **GND**. In such an event, the output voltage rises and is monitored with the overvoltage protection comparator over the **OS** pin. See the functional block diagram. As soon as the comparator trips at typically 20 V, TPS65161, the boost converter turns the N-Channel MOSFET switch off. The output voltage falls below the overvoltage threshold and the converter continues to operate.

Frequency Select Pin (FREQ)

The frequency select pin (**FREQ**) allows setting the switching frequency of the entire device to 500 kHz (**FREQ** = low) or 750 kHz (**FREQ** = high). A lower switching frequency gives a higher efficiency with a slightly reduced load transient regulation.

Thermal Shutdown

A thermal shutdown is implemented to prevent damage caused by excessive heat and power dissipation. Typically, the thermal shutdown threshold is 155°C.

Step-Down Converter

The nonsynchronous step-down converter operates at a fixed switching frequency using a fast response voltage mode topology with input voltage feedforward. This topology allows simple internal compensation, and it is designed to operate with ceramic output capacitors. The converter drives an internal 3.2-A N-channel MOSFET switch. The MOSFET driver is referenced to the switch pin **SWB**. The N-channel MOSFET requires a gate drive voltage higher than the switch pin to turn the N-Channel MOSFET on. This is accomplished by a bootstrap gate drive circuit running of the step-down converter switch pin. When the switch pin **SWB** is at ground, the bootstrap capacitor is charged to 8 V. This way, the N-channel gate drive voltage is typically around 8 V.

Soft Start (Step-Down Converter)

To avoid high inrush current during start-up, an internal soft start is implemented in the TPS65161. When the step-down converter is enabled over EN1, its reference voltage slowly rises from zero to its power-good threshold of typically 90% of V_{ref} . When the reference voltage reaches this power-good threshold, the error amplifier is released to its normal operation at its normal duty cycle. To further limit the inrush current during soft start, the converter frequency is set to $1/4^{th}$ of the switching frequency f_s and then $1/2$ of f_s determined by the comparator that monitors the feedback voltage. See the internal block diagram. Soft start is typically completed within 1 ms.

Short-Circuit Protection (Step-Down Converter)

To limit the short-circuit current, the device has a cycle-by-cycle current limit. To avoid the short-circuit current rising above the internal current limit when the output is shorted to GND, the switching frequency is reduced as well. This is implemented by two comparators monitoring the feedback voltage. The step-down converter switching frequency is reduced to $1/2$ of f_s when the feedback is below 0.9 V and to $1/4^{th}$ of the switching frequency when the feedback voltage is below 0.6 V.

Positive Charge Pump

The positive charge pump provides a regulated output voltage set by the external resistor divider. [Figure 16](#) shows an extract of the positive charge-pump driver circuit. The operation of the charge-pump driver can be understood best with [Figure 16](#). During the first cycle, Q3 is turned on and the flying capacitor C_{fly} charges to the source voltage, V_S . During the next clock cycle, Q3 is turned off and the current source charges the drive pin, DRP, up to the supply voltage, $V_{(SUP)}$. Because the flying capacitor voltage sits on top of the drive pin voltage, the maximum output voltage is $V_{(SUP)} + V_S$. The SUP pin can be connected either to the input voltage V_{IN} of the TPS65161 or the output voltage of the main boost converter V_S .

Figure 16. Extract of the Positive Charge-Pump Driver

If higher output voltages are required, another charge-pump stage can be added to the output.

Setting the output voltage:

$$V_{\text{out}} = 1.213 \times \left(1 + \frac{R5}{R6} \right)$$

$$R5 = R6 \times \left(\frac{V_{\text{out}}}{V_{\text{FB}}} - 1 \right) = R6 \times \left(\frac{V_{\text{out}}}{1.213} - 1 \right)$$

Negative Charge Pump

The negative charge pump provides a regulated output voltage set by the external resistor divider. The negative charge pump operates similar to the positive charge pump with the difference that it runs from the input voltage V_{IN} . The negative charge pump driver inverts the input voltage. The maximum negative output voltage is $V_{\text{GL}} = (-V_{\text{IN}}) + V_{\text{drop}}$. V_{drop} is the voltage drop across the external diodes and internal charge-pump MOSFETs. In case V_{GL} needs to be lower than $-V_{\text{IN}}$, an additional charge-pump stage needs to be added.

Setting the output voltage:

$$V_{\text{out}} = -V_{\text{REF}} \times \frac{R3}{R4} = -1.213 \text{ V} \times \frac{R3}{R4}$$

$$R3 = R4 \times \frac{|V_{\text{out}}|}{V_{\text{REF}}} = R4 \times \frac{|V_{\text{out}}|}{1.213}$$

The lower feedback resistor value, $R4$, should be in a range between 40 k Ω to 120 k Ω or the overall feedback resistance should be within 500 k Ω to 1 M Ω . Smaller values load the reference too heavily, and larger values may cause stability problems. The negative charge pump requires two external Schottky diodes. The peak current rating of the Schottky diode has to be twice the load current of the output. For a 20-mA output current, the dual-Schottky diode BAV99 is a good choice.

Power-On Sequencing (EN1, EN2, DLY1, DLY2)

The TPS65161 has an adjustable power-on sequencing set by the capacitors connected to DLY1 and DLY2 and controlled by EN1 and EN2. Pulling EN1 high enables the step-down converter and then the negative charge-pump driver. DLY1 sets the delay time between the step-down converter and negative charge-pump driver. EN2 enables the boost converter and positive charge-pump driver at the same time. DLY2 sets the delay time between the step-down converter $V_{\text{(LOGIC)}}$ and the boost converter V_{S} . This is especially useful to adjust the delay when EN2 is always connected to V_{IN} . If EN2 goes high after the step-down converter is already enabled, then the delay DLY2 starts when EN2 goes high. See Figure 17 and Figure 18.

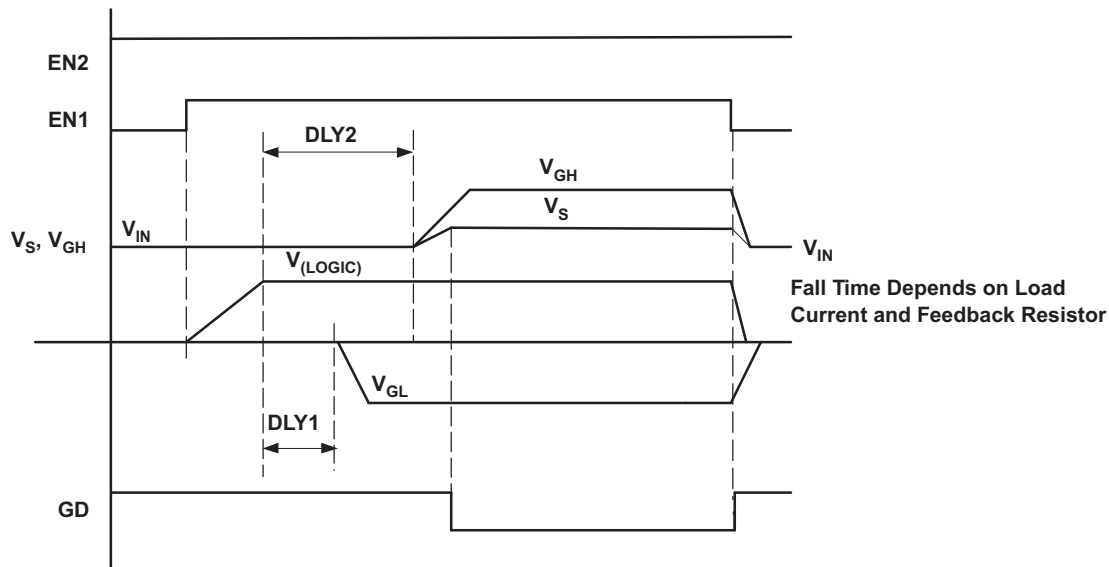

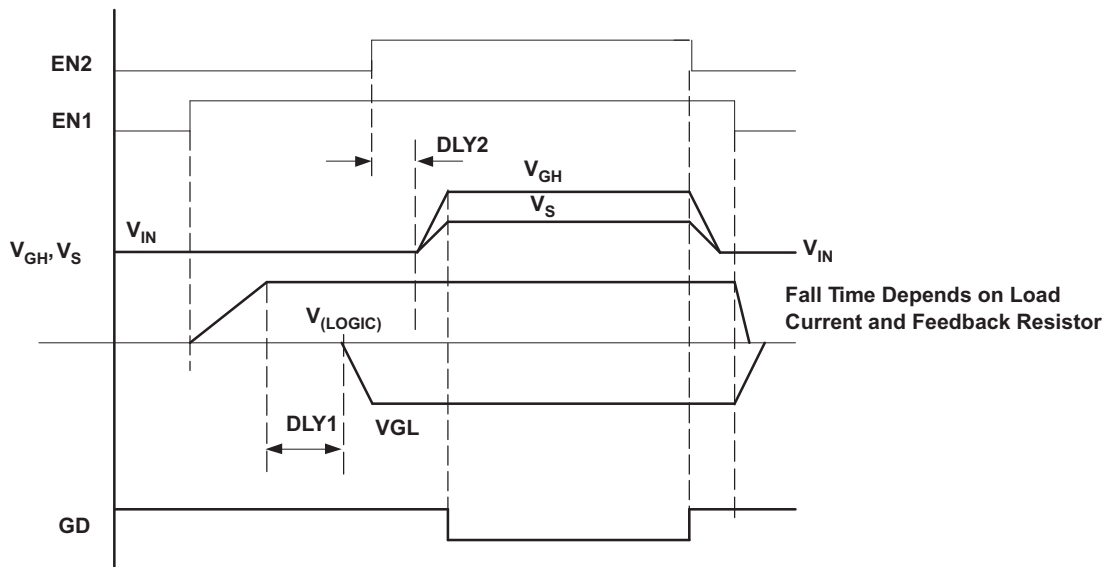

Figure 17. Power-On Sequencing With EN2 Always High (EN2 = V_{IN})

Figure 18. Power-On Sequencing Using EN1 and EN2

Setting the Delay Times DLY1, DLY2

Connecting an external capacitor to the DLY1 and DLY2 pins sets the delay time. If no delay time is required, these pins can be left open. To set the delay time, the external capacitor connected to DLY1 and DLY2 is charged with a constant current source of typically 4.8 μA . The delay time is terminated when the capacitor voltage has reached the internal reference voltage of $V_{\text{ref}} = 1.213 \text{ V}$. The external delay capacitor is calculated:

$$C_{\text{dly}} = \frac{4.8 \mu\text{A} \times t_d}{V_{\text{ref}}} = \frac{4.8 \mu\text{A} \times t_d}{1.213 \text{ V}} \quad \text{with } t_d = \text{Desired delay time}$$

Example for setting a delay time of 2.3 ms:

$$C_{\text{dly}} = \frac{4.8 \mu\text{A} \times 2.3 \text{ ms}}{1.213 \text{ V}} = 9.4 \text{ nF} \Rightarrow C_{\text{dly}} = 10 \text{ nF}$$

Gate Drive Pin (GD)

This is an open-drain output that goes low when the boost converter, V_S , is within regulation. The gate drive pin GD remains low until the input voltage or enable EN2 is cycled to ground.

Undervoltage Lockout

To avoid incorrect operation of the device at low input voltages, an undervoltage lockout is included which shuts down the device at voltages lower than 6 V.

Input Capacitor Selection

For good input voltage filtering, low ESR ceramic capacitors are recommended. The TPS65161 has an analog input, AVIN, and two input pins for the buck converter VINB. A 1- μF input capacitor should be connected directly from the AVIN to GND. Two 22- μF ceramic capacitors are connected in parallel from the buck converter input VINB to GND. For better input voltage filtering, the input capacitor values can be increased. See [Table 1](#) and the Application Information section for input capacitor recommendations.

Table 1. Input Capacitor Selection

CAPACITOR	VOLTAGE RATING	COMPONENT SUPPLIER	COMMENTS
22 μF/1210	16 V	Taiyo Yuden EMK325BY226MM	C _{IN} (VINB)
1 μF/1206	16 V	Taiyo Yuden EMK316BJ106KL	C _{IN} (AVIN)

Boost Converter Design Procedure

The first step in the design procedure is to verify whether the maximum possible output current of the boost converter supports the specific application requirements. A simple approach is to use the converter efficiency, by taking the efficiency numbers from the provided efficiency curves or to use a worst-case assumption for the expected efficiency, e.g., 80%.

1. Duty Cycle:

$$D = 1 - \frac{V_{in} \times \eta}{V_{out}}$$

2. Maximum output current:

$$I_{avg} = (1 - D) \times I_{sw} = \frac{V_{in}}{V_{out}} \times 2.8 \text{ A with } I_{sw} = \text{minimum switch current of the TPS65161 (2.8 A).}$$

3. Peak switch current:

$$I_{swpeak} = \frac{V_{in} \times D}{2 \times f_s \times L} + \frac{I_{out}}{1 - D}$$

With

I_{sw} = converter switch current (minimum switch current limit = 2.8 A)

f_s = converter switching frequency (typical 500 kHz/750 kHz)

L = Selected inductor value

η = Estimated converter efficiency (use the number from the efficiency curves or 0.8 as an estimation)

The peak switch current is the steady-state peak switch current that the integrated switch, inductor, and external Schottky diode must be able to handle. The calculation must be done for the minimum input voltage where the peak switch current is highest.

Inductor Selection (Boost Converter)

The TPS65161 operates typically with a 10-μH inductor. Other possible inductor values are 6.8-μH or 22-μH. The main parameter for the inductor selection is the saturation current of the inductor, which should be higher than the peak switch current as previously calculated, with additional margin to cover for heavy load transients. The alternative, more conservative approach, is to choose the inductor with saturation current at least as high as the typical switch current limit of 3.5 A. The second important parameter is the inductor dc resistance. Usually, the lower the dc resistance the higher the efficiency. The efficiency difference between different inductors can vary between 2% to 10%. Possible inductors are shown in [Table 2](#).

Table 2. Inductor Selection (Boost Converter)

INDUCTOR VALUE	COMPONENT SUPPLIER	DIMENSIONS in mm	I _{sat} /DCR
22 μH	Coilcraft MSS1038-103NX	10,2 × 10,2 × 3,6	2.9 A/73 mΩ
22 μH	Coilcraft DO3316-103	12,85 × 9,4 × 5,21	3.8 A/38 mΩ
10 μH	Sumida CDRH8D43-100	8,3 × 8,3 × 4,5	4.0 A/29 mΩ
10 μH	Sumida CDH74-100	7,3 × 8,0 × 5,2	2.75 A/43 mΩ
10 μH	Coilcraft MSS1038-103NX	10,2 × 10,2 × 3,6	4.4 A/35 mΩ
6.8 μH	Wuerth Elektronik 7447789006	7,3 × 7,3 × 3,2	2.5 A/44 mΩ

Output Capacitor Selection (Boost Converter)

For best output voltage filtering, a low ESR output capacitor is recommended. Ceramic capacitors have a low ESR value and work best with the TPS65161. Usually, three 22- μ F ceramic output capacitors in parallel are sufficient for most applications. If a lower voltage drop during load transients is required, more output capacitance can be added. See [Table 3](#) for the selection of the output capacitor.

Table 3. Output Capacitor Selection (Boost Converter)

CAPACITOR	VOLTAGE RATING	COMPONENT SUPPLIER
22 μ F/1812	16 V	Taiyo Yuden EMK432BJ226MM

Rectifier Diode Selection (Boost Converter)

To achieve high efficiency, a Schottky diode should be used. The reverse voltage rating should be higher than the maximum output voltage of the converter. The average rectified forward-current rating needed for the Schottky diode is calculated as the off-time of the converter times the maximum switch current of the TPS65161:

$$D = 1 - \frac{V_{in}}{V_{out}}$$

$$I_{avg} = (1 - D) \times I_{sw} = \frac{V_{in}}{V_{out}} \times 2.8 \text{ A with } I_{sw} = \text{minimum switch current of the TPS65161 (2.8 A).}$$

Usually, a Schottky diode with 2-A maximum average rectified forward-current rating is sufficient for most applications. Secondly, the Schottky rectifier has to be able to dissipate the power. The dissipated power is the average rectified forward current times the diode forward voltage.

$$P_D = I_{avg} \times V_F = I_{sw} \times (1 - D) \times V_F \text{ (with } I_{sw} = \text{minimum switch current of the TPS65161 (2.8 A).)}$$

Table 4. Rectifier Diode Selection (Boost Converter)

CURRENT RATING I_{avg}	V_r	$V_{forward}$	$R_{\theta JA}$	SIZE	COMPONENT SUPPLIER
3 A	20 V	0.36 at 3 A	46°C/W	SMC	MBRS320, International Rectifier
2 A	20 V	0.44 V at 3 A	75°C/W	SMB	SL22, Vishay Semiconductor
2 A	20 V	0.5 at 2 A	75°C/W	SMB	SS22, Fairchild Semiconductor

Setting the Output Voltage and Selecting the Feedforward Capacitor (Boost Converter)

The output voltage is set by the external resistor divider and is calculated as:

$$V_{out} = 1.146 \text{ V} \times \left(1 + \frac{R1}{R2} \right)$$

Across the upper resistor, a bypass capacitor is required to achieve a good load transients response and to have a stable converter loop. Together with R1, the bypass capacitor C_{ff} sets a zero in the control loop. Depending on the inductor value, the zero frequency needs to be set. For a 6.8- μ H or 10- μ H inductor, $f_z = 10$ kHz and for a 22- μ H inductor, $f_z = 7$ kHz.

$$C_{ff} = \frac{1}{2 \times \pi \times f_z \times R1} = \frac{1}{2 \times \pi \times 10 \text{ kHz} \times R1}$$

A value coming closest to the calculated value should be used.

Compensation (COMP) (Boost Converter)

The regulator loop can be compensated by adjusting the external components connected to the COMP pin. The COMP pin is the output of the internal transconductance error amplifier. A single capacitor connected to this pin sets the low-frequency gain. Usually, a 22-nF capacitor is sufficient for most of the applications. Adding a series resistor sets an additional zero and increases the high-frequency gain. The following formula calculates at what frequency the resistor increases the high-frequency gain.

$$f_z = \frac{1}{2 \times \pi \times C_c \times R_c}$$

Lower input voltages require a higher gain and therefore a lower compensation capacitor value.

Step-Down Converter Design Procedure

Setting the Output Voltage

The step-down converter uses an external voltage divider to set the output voltage. The output voltage is calculated as:

$$V_{out} = 1.213 \text{ V} \times \left(1 + \frac{R_1}{R_2} \right)$$

with R2 as 1.2 kΩ, and internal reference voltage $V_{(ref)typ} = 1.213 \text{ V}$

At load current <1 mA, the device operates in discontinuous conduction mode. When the load current is reduced to zero, the output voltage rises slightly above the nominal output voltage. At zero load current, the device skips clock cycles but does not completely stop switching; thus, the output voltage sits slightly higher than the nominal output voltage. Therefore, the lower feedback resistor is selected to be around 1.2 kΩ to always have around 1-mA minimum load current.

Selecting the Feedforward Capacitor

The feedforward capacitor across the upper feedback resistor divider sets a zero in the converter loop transfer function. For a 15-μH inductor, $f_z = 8 \text{ kHz}$ and when a 22-μH inductor is used, $f_z = 17 \text{ kHz}$.

(Example for the 3.3-V output)

$$C_z = \frac{1}{2 \times \pi \times 8 \text{ kHz} \times R_1} = \frac{1}{2 \times \pi \times 8 \text{ kHz} \times 2\text{k}\Omega} = 9.9 \text{ nF} \approx 10 \text{ nF}$$

Usually a capacitor value closest to the calculated value is selected.

Inductor Selection (Step-Down Converter)

The TPS65161 typically operates with a 15-μH inductor value. For high efficiencies, the inductor should have a low dc resistance to minimize conduction losses. This needs to be considered when selecting the appropriate inductor. In order to avoid saturation of the inductor, the inductor should be rated at least for the maximum output current of the converter, plus the inductor ripple current that is calculated as:

$$\Delta I_L = V_{out} \times \frac{1 - \frac{V_{out}}{V_{in}}}{L \times f} \quad I_{Lmax} = I_{outmax} + \frac{\Delta I_L}{2}$$

With:

f = Switching frequency (750 kHz, 500 kHz minimal)

L = Inductor value (typically 15 μH)

ΔI_L = Peak-to-peak inductor ripple current

I_{Lmax} = Maximum inductor current

The highest inductor current occurs at maximum V_{IN} . A more conservative approach is to select the inductor current rating just for the typical switch current of 3.2 A.

Table 5. Inductor Selection (Step-Down Converter)

INDUCTOR VALUE	COMPONENT SUPPLIER	DIMENSIONS in mm	Isat/DCR
15 μH	Wuerth 7447789115	7,3 × 7,3 × 3,2	1.75 A/100 mΩ
15 μH	Sumida CDRH8D28-150	8,3 × 8,3 × 3,0	1.9 A/53 mΩ
15 μH	Sumida CDRH8D38-150	8,3 × 8,3 × 4,0	2.3 A/53 mΩ
15 μH	Coilcraft MSS1038-153NX	10,2 × 10,2 × 3,6	2.7 A/50 mΩ

Rectifier Diode Selection (Step-Down Converter)

To achieve high efficiency, a Schottky diode should be used. The reverse voltage rating should be higher than the maximum output voltage of the step-down converter. The averaged rectified forward current at which the Schottky diode needs to be rated is calculated as the off-time of the step-down converter times the maximum switch current of the TPS65161:

$$D = \frac{V_{out}}{V_{in}}$$

$$I_{avg} = (1 - D) \times I_{sw} = \left(1 - \frac{V_{out}}{V_{in}}\right) \times 2.5 \text{ A} \quad \text{with } I_{sw} = \text{minimum switch current of the TPS65161 (2.5 A)}$$

Usually, a Schottky diode with 1.5-A or 2-A maximum average rectified forward current rating is sufficient for most applications. Secondly, the Schottky rectifier has to be able to dissipate the power. The dissipated power is the average rectified forward current times the diode forward voltage.

$$P_D = I_{avg} \times V_F = I_{sw} \times (1 - D) \times V_F \quad \text{with } I_{sw} = \text{minimum switch current of the TPS65161 (2.5 A)}.$$

Table 6. Rectifier Diode Selection (Step-Down Converter)

CURRENT RATING I_{avg}	V_r	$V_{forward}$	$R_{\theta JA}$	SIZE	COMPONENT SUPPLIER
3 A	20 V	0.36 V at 3 A	46°C/W	SMC	MBRS320, International Rectifier
2 A	20 V	0.44 V at 2 A	75°C/W	SMB	SL22, Vishay Semiconductor
2 A	20 V	0.5 V at 2 A	75°C/W	SMB	SS22, Fairchild Semiconductor
1.5 A	20 V	0.445 V at 1 A	88°C/W	SMA	SL12, Vishay Semiconductor

Output Capacitor Selection (Step-Down Converter)

The device is designed to work with ceramic output capacitors. When using a 15- μ H inductor, two 22- μ F ceramic output capacitors are recommended. More capacitance can be added to improve the load transient response.

Table 7. Output Selection (Step-Down Converter)

Layout Consideration

The PCB layout is an important step in the power supply design. An incorrect layout could cause converter instability, load regulation problems, noise, and EMI issues. Especially with a switching dc-dc converter at high load currents, too-thin PCB traces can cause significant voltage spikes. Good grounding becomes important as well. If possible, a common ground plane to minimize ground shifts between analog (GND) and power ground (PGND) is recommended. Additionally, the following PCB design layout guidelines are recommended for the TPS65161:

1. Separate the power supply traces for AVIN and VINB, and use separate bypass capacitors.
2. Use a short and wide trace to connect the OS pin to the output of the boost converter.
3. To minimize noise coupling into the OS pin, use a 470-pF bypass capacitor to GND.
4. Place the rectifier diode of the step down converter as close as possible to the SWB pin.
5. Use short traces for the charge-pump drive pins (DRN, DRP) of V_{GH} and V_{GL} because these traces carry switching waveforms.
6. Place a 1- μ F bypass capacitor from the SUP pin to GND.
7. Place the flying capacitors as close as possible to the DRP and DRN pin, avoiding a high voltage spike at these pins.
8. Place the Schottky diodes as close as possible to the IC, respective to the flying capacitors connected to the DRP and DRN.
9. Route the feedback network of the negative charge pump away from the drive pin traces (DRN) of the negative charge pump. This avoids parasitic coupling into the feedback network of the negative charge pump giving good output voltage accuracy and load regulation. To do this, use the FREQ pin and trace to isolate DRN from FBN.
10. Connect a 220-nF capacitor directly from the REF pin (24) to GND (23) for a stable and noise free reference voltage.

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Body dimensions do not include mold flash or protrusions. Mold flash and protrusion shall not exceed 0.15 per side.
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <<http://www.ti.com>>.
 - E. Falls within JEDEC MO-153

PowerPAD is a trademark of Texas Instruments.

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>. Publication IPC-7351 is recommended for alternate designs.
 - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
 - F. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
- PowerPAD is a trademark of Texas Instruments.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
