TOSHIBA Bipolar Linear Integrated Circuit Silicon Monolithic

## TA6038FN,TA6038FNG

## Shock Sensor IC

TA6038FN/FNG detects an existence of external shock through the shock sensor and output.

## Features

- TA6038FN/FNG operates from 2.7 to 5.5 V DC single power supply voltage.
- Signal from the shock sensor is amplified according to setting gain, and is detected through the internal window comparator.
- TA6038FN/FNG incorporates 1 -ch shock detecting circuitry.

Weight: 0.04 g (typ.)

- Input terminal of sensor signal is designed high impedance. Differential input impedance $=100 \mathrm{M} \Omega$ (typ.)
- LPF (low pass filter) circuitry is incorporated.

Cut-off frequency of LPF $=7 \mathrm{kHz}$

- Sensitivity of shock detection can be adjusted by external devices.
- Small package

SSOP10-P-0.65A ( 0.65 mm pitch)

## Block Diagram

Pin Connection (top view)

## Pin Function

| Pin No. | Pin Name | Function |
| :---: | :---: | :--- |
| 1 | SOA | Amp (A) output terminal |
| 2 | SIA | Connection terminal of shock sensor |
| 3 | SIB | Connection terminal of shock sensor |
| 4 | SOB | Amp (B) output terminal |
| 5 | GND | Ground terminal |
| 6 | VCC | Power supply voltage |
| 7 | AO | Op-Amp output terminal |
| 8 | AI | Op-Amp input terminal |
| 9 | DO | Differential-Amp output terminal |
| 10 | OUT | Output terminal (output = "L" when shock is detected.) |

## Maximum Ratings $\left(\mathbf{T a}=\mathbf{2 5}{ }^{\circ} \mathrm{C}\right.$ )

| Characteristics | Symbol | Rating | Unit |
| :--- | :---: | :---: | :---: |
| Power supply voltage | $\mathrm{V}_{\mathrm{CC}}$ | 7 | V |
| Power dissipation | $\mathrm{P}_{\mathrm{D}}$ | 300 | mW |
| Storage temperature | $\mathrm{T}_{\text {stg }}$ | -55 to 150 | ${ }^{\circ} \mathrm{C}$ |

## Recommend Operating Condition

| Characteristics | Symbol | Rating | Unit |
| :--- | :---: | :---: | :---: |
| Power supply voltage | $\mathrm{V}_{\mathrm{CC}}$ | 2.7 to 5.5 | V |
| Operating temperature | $\mathrm{T}_{\mathrm{opr}}$ | -25 to 85 | ${ }^{\circ} \mathrm{C}$ |

Note: The IC may be destroyed due to short circuit between adjacent pins, incorrect orientation of device's mounting, connecting positive and negative power supply pins wrong way round, air contamination fault, or fault by improper grounding.

Electrical Characteristics (unless otherwise specified, $\mathrm{V}_{\mathrm{cc}}=\mathbf{3 . 3} \mathrm{V}, \mathbf{T a}=\mathbf{2 5}{ }^{\circ} \mathrm{C}$ )

| Characteristics | Symbol | Test Circuit | Test Condition | Min | Typ. | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Supply voltage | $\mathrm{V}_{\mathrm{CC}}$ | - | - | 2.7 | 3.3 | 5.5 | V |
| Supply current | ICC | (1) | $\mathrm{V}_{\mathrm{CC}}=3.3 \mathrm{~V}$ | - | 1.8 | 2.5 | mA |
|  |  |  | $\mathrm{V}_{\mathrm{CC}}=5.0 \mathrm{~V}$ | - | 1.8 | 2.5 |  |

## Application Note

## Figure 1 The Configuration of G-Force Sensor Amplifier

Figure 1 shows the configuration of G-Force sensor amplifier. The shock sensor is connected between the pins 2 and 3.
< How to output 0 or 1 from the pin 10 to detect whether there is a shock or not. >

- Using a sensor with the sensitivity Qs ( $\mathrm{pC} / \mathrm{G}$ ) to detect the shock $\mathrm{g}(\mathrm{G})$. -
a. Setting gain: $\mathrm{C} 1=\mathrm{C} 2(\mathrm{pF}), \mathrm{R} 1(\mathrm{k} \Omega), \mathrm{R} 2(\mathrm{k} \Omega)$

$$
\begin{aligned}
& \frac{\mathrm{Qs} \times \mathrm{g}}{\mathrm{C} 1} \times 2 \times 5 \times \frac{\mathrm{R} 2}{\mathrm{R} 1}=0.4(\mathrm{~V}) \\
& \mathrm{C} 1=\mathrm{C} 2=\frac{\mathrm{Qs} \times \mathrm{g}}{0.04} \times \frac{\mathrm{R} 2}{\mathrm{R} 1}
\end{aligned}
$$

Example: Detecting $5(\mathrm{G})$-shock using a sensor with Qs $=0.34(\mathrm{pC} / \mathrm{G}), \mathrm{R} 1=10(\mathrm{k} \Omega), \mathrm{R} 2=100(\mathrm{k} \Omega)$.
$\mathrm{C} 1=\mathrm{C} 2=\frac{0.34 \times 5}{0.04} \times \frac{100}{10}=425(\mathrm{pF})$
b. Setting the frequency ( Hz ) of HPF: Setting C3 ( $\mu \mathrm{F}$ ), R1 ( $\mathrm{k} \Omega$ )

$$
\mathrm{fc}(\mathrm{~Hz})=\frac{1}{2 \times \pi \times \mathrm{R} 1 \times \mathrm{C} 3} \times 10^{3}
$$

Example: Setting the frequency to 20 Hz with $R 1=10(\mathrm{k} \Omega)$.

$$
\mathrm{C} 3=\frac{1}{2 \times \pi \times 10 \times 20} \times 10^{3}=0.8(\mu \mathrm{~F})
$$

c. Setting the frequency ( kHz ) of LPF: Setting C4 (pF), R2 (k $\Omega$ )

$$
\mathrm{fc}(\mathrm{kHz})=\frac{1}{2 \times \pi \times \mathrm{R} 2 \times \mathrm{C} 4} \times 10^{6}
$$

$$
\mathrm{C} 4=\frac{1}{2 \times \pi \times 100 \times 5} \times 10^{6}=318(\mathrm{pF})
$$

< How to output the voltage according to the shock through the pin 7. >

- Using a sensor with the sensitivity Qs (pC/G), and assuming the shock sensitivity of the system is Vsystem (mV/G). -
a. Setting gain: $\mathrm{C} 1=\mathrm{C} 2(\mathrm{pF}), \mathrm{R} 1(\mathrm{k} \Omega), \mathrm{R} 2(\mathrm{k} \Omega)$

$$
\begin{aligned}
& \frac{\mathrm{Qs}}{\mathrm{C} 1} \times 2 \times 5 \times \frac{\mathrm{R} 2}{\mathrm{R} 1}=\mathrm{V} \text { system } \times 10^{3}(\mathrm{mV} / \mathrm{G}) \\
& \mathrm{C} 1=\mathrm{C} 2=\frac{\mathrm{Qs}}{\mathrm{~V} \text { system }} \times \frac{\mathrm{R} 2}{\mathrm{R} 1} \times 10^{4}(\mathrm{pF})
\end{aligned}
$$

Example: Designing the system with 200 ( $\mathrm{mV} / \mathrm{G}$ ) by using a sensor that $\mathrm{Qs}=0.34(\mathrm{pC} / \mathrm{G})$,
$\mathrm{R} 1=10(\mathrm{k} \Omega), \mathrm{R} 2=100(\mathrm{k} \Omega)$.
$\mathrm{C} 1=\mathrm{C} 2=\frac{0.34}{200} \times \frac{100}{10} \times 10^{4}=170(\mathrm{pF})$

- The information contained herein is subject to change without notice.
- The information contained herein is presented only as a guide for the applications of our products. No responsibility is assumed by TOSHIBA for any infringements of patents or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of TOSHIBA or others.
- TOSHIBA is continually working to improve the quality and reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to comply with the standards of safety in making a safe design for the entire system, and to avoid situations in which a malfunction or failure of such TOSHIBA products could cause loss of human life, bodily injury or damage to property.
In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent TOSHIBA products specifications. Also, please keep in mind the precautions and conditions set forth in the "Handling Guide for Semiconductor Devices," or "TOSHIBA Semiconductor Reliability Handbook" etc..
- The TOSHIBA products listed in this document are intended for usage in general electronics applications (computer, personal equipment, office equipment, measuring equipment, industrial robotics, domestic appliances, etc.). These TOSHIBA products are neither intended nor warranted for usage in equipment that requires extraordinarily high quality and/or reliability or a malfunction or failure of which may cause loss of human life or bodily injury ("Unintended Usage"). Unintended Usage include atomic energy control instruments, airplane or spaceship instruments, transportation instruments, traffic signal instruments, combustion control instruments, medical instruments, all types of safety devices, etc.. Unintended Usage of TOSHIBA products listed in this document shall be made at the customer's own risk.
- TOSHIBA products should not be embedded to the downstream products which are prohibited to be produced and sold, under any law and regulations.
