

## FIN1215 / FIN1216 / FIN1217 FIN1218 LVDS 21-Bit Serializers / De-Serializers

### Features

- Low Power Consumption
- 20MHz to 85MHz Shift Clock Support
- 50% Duty Cycle on the Clock Output of Receiver
- ±1V Common-mode Range ~1.2V
- Narrow Bus Reduces Cable Size and Cost
- High Throughput: 1.785Gbps
- Up to 595Mbps per Channel
- Internal PLL with No External Components
- Compatible with TIA/EIA-644 Specification
- Offered in 48-lead TSSOP Packages

### Description

The FIN1217 and FIN1215 transform 21-bit wide parallel LVTTTL (Low-Voltage TTL) data into three serial LVDS (Low-Voltage Differential Signaling) data streams. A phase-locked transmit clock is transmitted in parallel with the data stream over a separate LVDS link. Every cycle of transmit clock, 21 bits of input LVTTTL data are sampled and transmitted.

The FIN1218 and FIN1216 receive and convert the three serial LVDS data streams back into 21 bits of LVTTTL data. Table 1 provides a matrix summary of the serializers and de-serializers available. For the FIN1217, at a transmit clock frequency of 85MHz, 21 bits of LVTTTL data are transmitted at a rate of 595Mbps per LVDS channel.

These chipsets solve EMI and cable size problems associated with wide and high-speed TTL interfaces.

## Truth Tables

### Transmitter

Inputs			Outputs	
TxIn	TxCLKIn	PwrDn <sup>(1)</sup>	TxOut±	TxCLKOut±
Active	Active	HIGH	LOW / HIGH	LOW / HIGH
Active	LOW / HIGH High Impedance	HIGH	LOW / HIGH	Don't Care <sup>(2)</sup>
Floating	Active	HIGH	LOW	LOW / HIGH
Floating	Floating	HIGH	LOW	Don't Care <sup>(2)</sup>
Don't Care	Don't Care	LOW	High Impedance	High Impedance

**Notes:**

1. The outputs of the transmitter or receiver remain in a high-impedance state until  $V_{CC}$  reaches 2V.
2. TxCLKOut± settles at a free running frequency when the part is powered up, PwrDn is HIGH and the TxCLKIn is a steady logic level LOW / HIGH / high-impedance.

### Receiver

Inputs			Outputs	
RxIn±	RxCLKIn±	/PwrDn <sup>(3)</sup>	RxOut	RxCLKOut
Active	Active	HIGH	LOW / HIGH	LOW / HIGH
Active	Failsafe Condition <sup>(4)</sup>	HIGH	Last Valid State	HIGH
Failsafe Condition <sup>(4)</sup>	Active	HIGH	HIGH	LOW / HIGH
Failsafe Condition <sup>(4)</sup>	Failsafe Condition <sup>(4)</sup>	HIGH	Last Valid State <sup>(5)</sup>	HIGH
Don't Care	Don't Care	LOW	LOW	HIGH

**Notes:**

3. The outputs of the transmitter or receiver remain in a high-impedance state until  $V_{CC}$  reaches 2V.
4. Failsafe condition is defined as the input being terminated and un-driven, shorted, or open.
5. If RxCLKIn± is removed prior to the RxIn± data being removed, RxOut is the last valid state. If RxIn± data is removed prior to RxCLKIn± being removed, RxOut is HIGH.

## Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

## Recommended Operating Conditions

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to Absolute Maximum Ratings.

Symbol	Parameter	Min.	Max.	Unit
$V_{CC}$	Supply Voltage	3.0	3.6	V
$T_A$	Operating Temperature	-40	+85	°C
$V_{CCNPP}$	Maximum Supply Noise Voltage <sup>(6)</sup>		100	mV <sub>PP</sub>

### Note:

- 100mV  $V_{CC}$  noise should be tested for frequency at least up to 2MHz. All the specifications should be met under such a noise level.

## Transmitter DC Electrical Characteristics

Typical values are at  $T_A=25^\circ\text{C}$  and with  $V_{CC}=3.3\text{V}$ ; minimum and maximum are at over supply voltages and operating temperatures ranges, unless otherwise specified.

### Notes:

- Positive current values refer to the current flowing into device and negative values means current flowing out of pins. Voltages are referenced to ground unless otherwise specified (except  $\Delta V_{OD}$  and  $V_{OD}$ ).
- The power supply current for both transmitter and receiver can be different with the number of active I/O channels.
- The 16-grayscale test pattern tests device power consumption for a "typical" LCD display pattern. The test pattern approximates signal switching needed to produce groups of 16 vertical strips across the display.
- FIN1217 only.

**Notes:**

11. Outputs of all transmitters stay in 3-STATE until power reaches 2V. Clock and data output begins to toggle 10ms after V<sub>CC</sub> reaches 3V and /PwrDn pin is above 1.5V.
12. This output data pulse position works for both transmitters with 21 TTL inputs, except the LVDS output bit mapping difference (see Figure 19). Figure 20 shows the skew between the first data bit and clock output. A two-bit cycle delay is guaranteed when the MSB is output from transmitter.
13. This jitter specification is based on the assumption that PLL has a reference clock with cycle-to-cycle input jitter of less than 2ns.

**Notes:**

16. Total channel latency from serializer to deserializer is  $(T + t_{TCCD}) + (2 \cdot T + t_{RCCD})$ .

17. Receiver skew margin is defined as the valid sampling window after considering potential setup/hold time and minimum/maximum bit position.

Note: The worst-case test pattern produces a maximum toggling of digital circuits, LVDS I/O and LVTTTL/CMOS I/O. Depending on the valid strobe edge of transmitter, the TxCLKIn can be either rising or falling edge data strobe.

Note: This output data pulse position works for both transmitters with 21 TTL inputs, except the LVDS output bit mapping difference. Two-bit cycle delay is guaranteed with the MSB is output from transmitter.

### AC Loadings and Waveforms (Continued)

Note:  $t_{RSKM}$  is the budget for the cable skew and source clock skew plus Inter-Symbol Interference (ISI). The minimum and maximum pulse position values are based on the bit position of each of the seven bits within the LVDS data stream across PVT (Process, Voltage Supply, and Temperature).

Note: This jitter pattern is used to test the jitter response (clock out) of the device over the power supply range with worst jitter  $\pm 3$ ns (cycle-to-cycle) clock input. The specific test methodology is as follows:

- Switching input data TxIn0 to TxIn20 at 0.5MHz and the input clock is shifted to left -3ns and to the right +3ns when data is HIGH (by switching between CLK1 and CLK2 in Figure 11).
- The  $\pm 3$ ns cycle-to-cycle input jitter is the static phase error between the two clock sources. Jumping between two clock sources to simulate the worst-case of clock edge jump (3ns) from graphical controllers. Cycle-to-cycle jitter at TxCLK out pin should be measured cross  $V_{CC}$  range with 100mV noise ( $V_{CC}$  noise frequency  $< 2$ MHz).

**DISCLAIMER**

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS. THESE SPECIFICATIONS DO NOT EXPAND THE TERMS OF FAIRCHILD'S WORLDWIDE TERMS AND CONDITIONS, SPECIFICALLY THE WARRANTY THEREIN, WHICH COVERS THESE PRODUCTS.

**LIFE SUPPORT POLICY**

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.
2. A critical component in any component of a life support, device, or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

**PRODUCT STATUS DEFINITIONS**

**Definition of Terms**

Datasheet Identification	Product Status	Definition
Advance Information	Formative / In Design	This datasheet contains the design specifications for product development. Specifications may change in any manner without notice.
Preliminary	First Production	This datasheet contains preliminary data; supplementary data will be published at a later date. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve design.
No Identification Needed	Full Production	This datasheet contains final specifications. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve the design.
Obsolete	Not In Production	This datasheet contains specifications on a product that is discontinued by Fairchild Semiconductor. The datasheet is for reference information only.
