

400MHz, 4x1 Video Crosspoint Switch

The HA4314B is a very wide bandwidth 4x1 crosspoint switch ideal for professional video switching, HDTV, computer monitor routing, and other high performance applications. The circuit features very low power dissipation (105mW Enabled, 4mW Disabled), excellent differential gain and phase, and very high off isolation. When disabled, the output is switched to a high impedance state, making the HA4314B ideal for routing matrix equipment.

The HA4314B requires no external current source, and features fast switching and symmetric slew rates.

For a 4x1 crosspoint with Tally outputs (channel indicators) or with synchronous control signals, please refer to the HA4404B and HA4344B data sheets, respectively.

For audio channels requiring larger signal swings, please refer to the CD22M3494 (16x8) data sheet.

Ordering Information

PART NUMBER	PART MARKING	TEMP. RANGE (°C)	PACKAGE	PKG. DWG. #

HA4314BCPZ (Note)	HA4314BCPZ	0 to +70	14 Ld PDIP** (Pb-free)	E14.3

*Add "96" suffix for tape and reel. Please refer to TB347 for details on reel specifications.

**Pb-free PDIPs can be used for through hole wave solder processing only. They are not intended for use in Reflow solder processing applications

NOTE: These Intersil Pb-free plastic packaged products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate PLUS ANNEAL - e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

Features

- Low Power Dissipation 105mW
- Symmetrical Slew Rates. 1400V/μs
- 0.1dB Gain Flatness 100MHz
- -3dB Bandwidth. 400MHz
- Off Isolation (100MHz) 70dB
- Crosstalk Rejection (30MHz) 80dB
- Differential Gain and Phase 0.01%/0.01 °
- High ESD Rating. >2000V
- TTL Compatible Control Inputs
- Improved Replacement for GX4314 and GX4314L
- Pb-Free Available (RoHS Compliant)

Applications

- Professional Video Switching and Routing
- HDTV
- Computer Graphics
- RF Switching and Routing
- PCM Data Routing

Thermal Information

Thermal Resistance (Typical, Note 1)	θ _{JA} (°C/W)
14 Ld PDIP Package*	95
14 Ld SOIC Package	120
16 Ld QSOP Package	140
Maximum Junction Temperature (Die)	+175°C
Maximum Junction Temperature (Plastic Package)	+150°C
Maximum Storage Temperature	-65°C to +150°C
Pb-free reflow profile	see link below
http://www.intersil.com/pbfree/Pb-FreeReflow.asp	
*Pb-free PDIPs can be used for through hole wave solder processing only. They are not intended for use in Reflow solder processing applications.	

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:

1. θ_{JA} is measured with the component mounted on a low effective thermal conductivity test board in free air. See Tech Brief TB379 for details.
2. If an input signal is applied before the supplies are powered up, the input current must be limited to these maximum values.

Electrical Specifications V_{SUPPLY} = ±5V, R_L = 10kΩ, V_{CS} = 0.8V, Unless Otherwise Specified.

NOTES:

- 3. Limits should be considered typical and are not production tested.
- 4. Parts are 100% tested at +25°C. Over-temperature limits established by characterization and are not production tested.

AC Test Circuit

NOTE: $C_L = C_X + \text{Test Fixture Capacitance}$.

PC Board Layout

The frequency response of this circuit depends greatly on the care taken in designing the PC board. **The use of low inductance components such as chip resistors and chip capacitors is strongly recommended, while a solid ground plane is a must!**

Attention should be given to decoupling the power supplies. A large value (10 μ F) tantalum in parallel with a small value (0.1 μ F) chip capacitor works well in most cases.

Keep input and output traces as short as possible, because trace inductance and capacitance can easily become the performance limiting items.

Application Information

General

The HA4314B is a 4x1 crosspoint switch that is ideal for the matrix element of high performance switchers and routers. This crosspoint's low input capacitance and high input resistance provide excellent video terminations when used with an external 75Ω resistor. Nevertheless, if several HA4314B inputs are connected together, the use of an input buffer should be considered (see Figure 1). This crosspoint contains no feedback or gain setting resistors, so the output is a true high impedance load when the IC is disabled ($\overline{CS} = 1$).

Ground Connections

All GND pins are connected to a common point on the die, so any one of them will suffice as the functional GND connection. For the best isolation and crosstalk rejection, however, all GND pins must connect to the GND plane.

Frequency Response

Most applications utilizing the HA4314B require a series output resistor, R_S , to tune the response for the specific load capacitance, C_L , driven. Bandwidth and slew rate degrade as C_L increases (as shown in the "Electrical Specifications" on page 4), so give careful consideration to component placement to minimize trace length. In big matrix configurations where C_L is large, better frequency response is obtained by cascading two levels of crosspoints in the case of multiplexed outputs (see Figure 2), or distributing the load between two drivers if C_L is due to bussing and subsequent stage input capacitance.

Control Signals

\overline{CS} - This is a TTL/CMOS compatible, active low Chip Select input. When driven high, \overline{CS} forces the output to a true high impedance state and reduces the power dissipation by a factor of 25. The \overline{CS} input has no on-chip pull-down resistor, so it must be connected to a logic low (recommend GND) if the enable function isn't utilized.

A0, A1 - These are binary coded, TTL/CMOS compatible address inputs that select which one of the four inputs connect to the crosspoint output.

Switcher/Router Applications

Figure 1 illustrates one possible implementation of a wideband, low power, 4x4 switcher/router utilizing the HA4314B for the switch matrix. A 4x4 switcher/router allows any of the four outputs to be driven by any one of the four inputs (e.g., each of the four inputs may connect to a different output, or an input may connect to multiple outputs). This application utilizes the HA4600 (video buffer with output disable) for the input buffer, the HA4314B as the switch matrix, and the HFA1112 (programmable gain buffer) as the gain of two output driver. Figure 2 details a 16x1 switcher (basically a 16:1 mux) which uses the HA4201 (1x1 crosspoint) and the HA4314B in a cascaded stage configuration to minimize capacitive loading at each output node, thus increasing system bandwidth.

Power-Up Considerations

No signals should be applied to the analog or digital inputs before the power supplies are activated. Latch-up may occur if the inputs are driven at the time of power-up. To prevent latch-up, the input currents during power-up must not exceed the values listed in the "Absolute Maximum Ratings" on page 3.

Intersil's Crosspoint Family

Intersil offers a variety of 4x1 and 1x1 crosspoint switches. In addition to the HA4314B, the 4x1 family includes the HA4404 and HA4344. The HA4404 is a 16 Ld device with Tally outputs to indicate the selected channel. The HA4344 is a 16 Ld crosspoint with synchronized control lines (A0, A1, \overline{CS}). With synchronization, the control information for the next channel switch can be loaded into the crosspoint without affecting the current state. On a subsequent clock edge the stored control state effects the desired channel switch.

The 1x1 family is comprised of the HA4201 and HA4600. They are essentially similar devices, but the HA4201 includes a Tally output (enable indicator). The 1x1s are useful as high performance video input buffers, or in a switch matrix requiring very high off isolation.

NOTES:

1. Controlling Dimensions: INCH. In case of conflict between English and Metric dimensions, the inch dimensions control.
2. Dimensioning and tolerancing per ANSI Y14.5M-1982.
3. Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication No. 95.
4. Dimensions A, A1 and L are measured with the package seated in JEDEC seating plane gauge GS-3.
5. D, D1, and E1 dimensions do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.010 inch (0.25mm).
6. E and e_A are measured with the leads constrained to be perpendicular to datum $-C-$.
7. e_B and e_C are measured at the lead tips with the leads unconstrained. e_C must be zero or greater.
8. B1 maximum dimensions do not include dambar protrusions. Dambar protrusions shall not exceed 0.010 inch (0.25mm).
9. N is the maximum number of terminal positions.
10. Corner leads (1, N, N/2 and N/2 + 1) for E8.3, E16.3, E18.3, E28.3, E42.6 will have a B1 dimension of 0.030 - 0.045 inch (0.76 - 1.14mm).
