

PC Power Supply Supervisors

SG6520

FEATURES

- Two 12V sense input pins: VS12 and VS12B
- Over voltage protection (OVP) for 3.3V, 5V, and two 12V
- Over current protection (OCP) for 3.3V, 5V, and two 12V
- Under voltage protection (UVP) for 3.3V, 5V, and two 12V
- Open drain output for PGO and FPO pins
- 300mS power good delay
- 300mS turn on delay for 3.3V, 5V and two 12V
- 2.8mS PSON control to FPO turn-off delay
- 48mS PSON control delay
- No lockup during the fast AC power on/off
- Wide supply voltage range from 4.2V to 15V
- Programmable over temperature protection(OTP)

DESCRIPTION

SG6520 is designed to provide the voltage, and current supervisor function, remote on/off (PSON) function,

power good (PGO) indicator function, and fault protection (FPO) function for switching power systems.

For supervisor function, it provides the over voltage protection (OVP) for 3.3V, 5V and two 12V; over current protection (OCP) for 3.3V, 5V and two 12V; under voltage protection (UVP) for 3.3V, 5V and two 12V. When 3.3V, 5V or 12V voltage is decreasing to 2.3V, 3.5V and 9V respectively, the under voltage protection (UVP) function will be enabled. FPO will be set to high to turn off the PWM controller IC. The voltage difference across external current shunt is used for OCP functions. An external resistor can be used to adjust protection threshold.

The power supply is turned on after 48mS delay time when PSON signal is set from high to low. To turn off power supply, PSON signal is set from low to high with the delay time 48mS. The PGI circuitry provides a power-down warning signal for PGO. When PGI input is lower than the internal 1.25V reference voltage, PGO signal is pulled low.

TYPICAL APPLICATION

PIN CONFIGURATION

ORDERING INFORMATION

Part Number	Pb-Free	Package Type
SG6520DZ		16 pin DIP Plastic
SG6520SZ (Preliminary)		16 pin SOP Plastic

PIN DESCRIPTIONS

Pin No.	Pin Name	Type	Description
1	PGI	Analog input	Power Good Input. For ATX SMPS, it detects AC line voltage through the main transformer.
2	GND	Supply	Ground.
3	FPO	Logic output	Fault Protection Output. Output signal to control the primary PWM IC through an opto-coupler. When FPO is low, the PWM IC is enabled.
4	PSON	Logic input	Remote On/Off logic input from CPU or main-board. The power supply will be turned on/off after 48mS delay.
5	IS12	Analog input	12V over current protection sense input. For typical application, this pin is connected to the positive end of a current shunt through one resistor. When the voltage on IS12 is higher than that of VS12 by 5mV, OCP will be enabled.
6	RI	Analog input	Reference setting. One external resistor Ri connected between RI and GND pin will determine a reference current, Iref = 1.25/Ri, for OCP programming.
7	IS12B	Analog input	12V over current protection sense input. For typical application, this pin is connected to the positive end of a current shunt through one resistor. When the voltage on IS12 is higher than that of VS12 by 5mV, OCP will be enabled.
8	VS12B	Analog input	Second 12V over/under-voltage control sense input.
9	OTP	Analog input	For over-temperature protection.
10	IS5	Analog input	5V over current protection sense input.
11	IS33	Analog input	3.3V over current protection sense input.
12	VS12	Analog input	12V over/under-voltage control sense input.
13	VS33	Analog input	3.3V over/under-voltage control sense input.
14	VS5	Analog input	5V over/under-voltage control sense input.
15	VDD	Supply	Supply voltage. 4.2V ~ 15V. For ATX SMPS, it is connected to 5V-standby and 12V through diodes respectively.
16	PGO	Logic output	Power good logic output, 0 or 1(open-drain). Power good=1 means that the power supply is good for operation. The power good delay is 300mS.

V _{HYST}	Hysteresis		0.18		0.23	V

TYPICAL CHARACTERISTICS

APPLICATION NOTE

Over Current Protection (OCP)

The SG6520 provides over current protection for the 3.3V, 5V and two 12V rails. Whenever an OCP condition occurs at any of the voltage rails, PGO will be low and FPO will be open. The internal OCP comparators have a very small offset voltage ($\pm 5mV$).

The sink currents of IS33, IS5, IS12 and IS12B are 8 times the current at the RI pin. The current at the RI pin is V_{RI}/R_i . Here is an example demonstrating how to set the over current protection.

If $I_1 * R_1 > (I_{RI} * 8) * R_2$, then OCP active.

How to select R2 Resistor:

If $R_1 = 5m\Omega$, $R_i = 30K$, OCP Protection Level is 35A, then

$$\begin{aligned}
 R_2 &= (I_1 * R_1) / (I_{RI} * 8) \\
 &= (35A * 5m\Omega) / \{(1.25V / 30K) * 8\} \\
 &= 525 \Omega
 \end{aligned}$$

DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS. THESE SPECIFICATIONS DO NOT EXPAND THE TERMS OF FAIRCHILD'S WORLDWIDE TERMS AND CONDITIONS, SPECIFICALLY THE WARRANTY THEREIN, WHICH COVERS THESE PRODUCTS.

LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.
2. A critical component in any component of a life support, device, or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
