| FSTUD16450 <br> Configurable 4-Bit to 20-Bit -2V Undershoot Protection <br> General Description <br> The Fairchild Universal Bus Switch FSTUD16450 provides 4-bit, 5 -bit, 8 -bit, 10-bit, 16-bit, 20-bit of high-speed CMOS TTL-compatible bus switching. The low On Resistance of the switch allows inputs to be connected to outputs without adding propagation delay or generating additional ground bounce noise. <br> The FSTUD16450 is designed to allow "customer" configuration control of the enable connections. The device is organized as either a 4-bit, 5 -bit, 10 -bit or 20 -bit bus switch. 8 -bit and 16 -bit configurations are also achievable (see Functional Description). The device's bit configuration is chosen through select pin logic. (see Truth Table). When $\overline{O E}_{x}$ is LOW, Port $A_{x}$ is connected to Port $B_{x}$. When $\overline{O E}_{x}$ is HIGH, the switch is OPEN. <br> The A and B Ports are "undershoot hardened" with UHC® protection to support an extended range to 2.0 V below ground. Fairchild's integrated "Undershoot Hardened Circuit" (UHC) senses undershoot at the I/Os, and responds by preventing voltage differentials from developing and turning on the switch. <br> Another key device feature is the addition of a level shifting select pin, " $\mathrm{S}_{2}$ ". When $\mathrm{S}_{2}$ is LOW, the device behaves as a standard N-MOS switch. When $\mathrm{S}_{2}$ is HIGH, a diode to $\mathrm{V}_{\mathrm{CC}}$ is integrated into the circuit allowing for level shifting between 5 V inputs and 3.3 V outputs. |  |

## Features

■ Undershoot hardened to -2V (A and B Ports)

- Voltage level shifting
- $4 \Omega$ switch connection between two ports
- Minimal propagation delay through the switch
- Low ICc
- Zero bounce in flow-through mode
- Control inputs compatible with TTL level
- See Applications Note AN-5008 for details

■ Also packaged in plastic Fine-Pitch Ball Grid Array (FBGA) (Preliminary)

## Applications Note

Select pins $S_{0}, S_{1}, S_{2}$ are intended to be used as static user configurable control pins. The AC performance of these pins has not been characterized or tested. Switching of these select pins during system operation may temporarily disrupt output logic states and/or enable pin controls.

## Functional Description

The device can also be configured as an 8 and 16-bit device by grounding the unused pins in Configurations 2 and 1 respectively. The 8 -bit configuration may also be achieved by tying two of the 4 -bit enables from configuration together and tying the remaining enable pin (OE) HIGH.

Note 2: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum rating The "Recommended Operating Conditions" table will define the conditions for actual device operation.
Note 3: $\mathrm{V}_{\mathrm{S}}$ is the voltage observed/applied at either the A or B Ports across the switch.
Note 4: The input and output negative voltage ratings may be exceeded if the input and output diode current ratings are observed.
Note 5: Unused control inputs must be held HIGH or LOW. They may not float.

Note 7: Measured by the voltage drop between A and B pins at the indicated current through the switch. On Resistance is determined by the lower of the voltages on the two ( A or B ) pins.

## Technology Description

The Fairchild Switch family derives from and embodies Fairchild's proven switch technology used for several years in its 74LVX3L384 (FST3384) bus switch product.

Fairchild does not assume any responsibility for use of any circuitry described, no circuit patent licenses are implied and Fairchild reserves the right at any time without notice to change said circuitry and specifications.
LIFE SUPPORT POLICY
FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
