

## 8-Channel/Dual 4-Channel 72V Analog Multiplexers

MAX14752/MAX14753

### General Description

The MAX14752/MAX14753 are 8-to-1 and dual 4-to-1 high-voltage analog multiplexers. Both devices feature 60Ω (typ) on-resistance with 0.03Ω (typ) on-resistance flatness. These low on-resistance multiplexers conduct equally well in either direction. Flexible logic levels for the channel-select interface are defined by the EN input.

The MAX14752 is a 8-to-1 multiplexer and MAX14753 is a dual 4-to-1 multiplexer. Both devices operate with dual supplies of ±10V to ±36V, or a single supply of +20V to +72V.

The MAX14752/MAX14753 are available in a 16-pin TSSOP package and are pin compatible with the industry-standard DG408/DG409. Both the MAX14752/MAX14753 are specified over the extended -40°C to +85°C operating temperature range.

### Applications

Programmable-Logic Controllers  
Environment Control Systems  
ATE Systems  
Medical Monitoring Systems  
Automotive

*Pin Configurations appear at end of data sheet.*

### Features

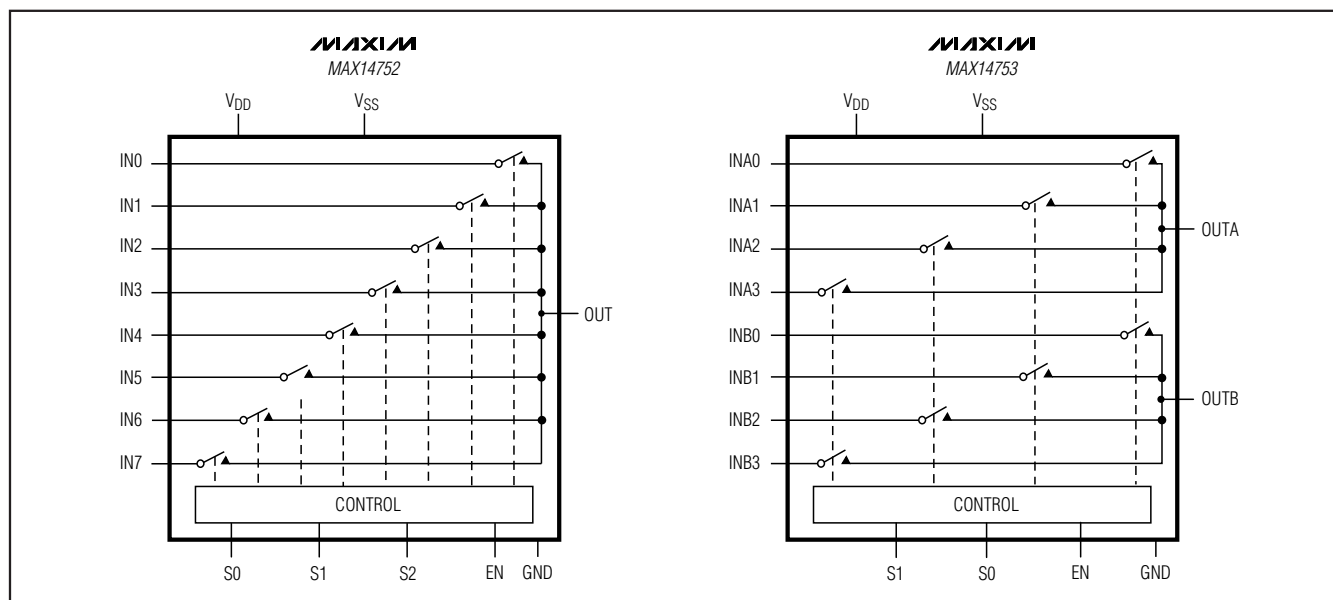

- ◆ Wide Dual Power-Supply Range ±36V (max)
- ◆ Wide Single Power-Supply Range +72V (max)
- ◆ Low On-Resistance 60Ω (typ)
- ◆ RON Flatness Over Common-Mode Voltage 0.03Ω (typ)
- ◆ Low-Input (20nA) On-Leakage Current (max)
- ◆ EN Voltage Defines Logic Level of S0, S1, and S2
- ◆ Low I<sub>DD</sub> (max) Supply Current in Disable Mode 25μA (max)
- ◆ Overvoltage/Undervoltage Clamp Through Protection Diodes
- ◆ Break-Before-Make Operation
- ◆ Pin Compatible with Industry-Standard DG408/DG409

### Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX14752EUE+	-40°C to +85°C	16 TSSOP
MAX14753EUE+	-40°C to +85°C	16 TSSOP

+ Denotes a lead-free/RoHS-compliant package.

### Functional Diagrams

# 8-Channel/Dual 4-Channel 72V Analog Multiplexers

## ABSOLUTE MAXIMUM RATINGS

V <sub>DD</sub> to V <sub>SS</sub> .....	-0.3V to +72V
GND to V <sub>SS</sub> .....	-0.3V to V <sub>DD</sub>
EN, S0, S1, S2 to GND .....	-0.3V to the lesser of (+12V and V <sub>DD</sub> + 0.3V)
IN <sub>-</sub> , INA <sub>-</sub> , INB <sub>-</sub> , OUT, OUTA, OUTB to V <sub>SS</sub> .....	-2V to (V <sub>DD</sub> - V <sub>SS</sub> + 2V) or 100mA (whichever occurs first)
Signal Slew Rate of IN <sub>-</sub> , INA <sub>-</sub> , INB <sub>-</sub> , OUT, OUTA, OUTB .....	see SOA in Figure 11
Continuous Current into IN <sub>-</sub> , INA <sub>-</sub> , INB <sub>-</sub> , OUT, OUTA, OUTB .....	100mA

Continuous Power Dissipation (T <sub>A</sub> = +70°C) 16-Pin TSSOP (derate 11.1mW/°C above +70°C) .....	890mW
Junction-to-Ambient Thermal Resistance (θ <sub>JA</sub> ) (Note 1) 16-Pin TSSOP .....	90°C/W
Junction-to-Case Thermal Resistance (θ <sub>JC</sub> ) (Note 1) 16-Pin TSSOP .....	27°C/W
Maximum Operating Temperature .....	-40°C to +125°C
Junction Temperature .....	+150°C
Storage Temperature Range .....	-65°C to +150°C
Lead Temperature (soldering, 10s) .....	+300°C

**Note 1:** Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to [www.maxim-ic.com/thermal-tutorial](http://www.maxim-ic.com/thermal-tutorial).

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

# 8-Channel/Dual 4-Channel 72V Analog Multiplexers

MAX14752/MAX14753

## Detailed Description

The MAX14752/MAX14753 are 8-to-1 and dual 4-to-1 high-voltage analog multiplexers. Both devices feature  $60\Omega$  (typ) on-resistance with  $0.03\Omega$  (typ) on-resistance flatness. These low on-resistance multiplexers conduct equally well in either direction.

The MAX14752 is an 8-to-1 multiplexer and MAX14753 is a dual 4-to-1 multiplexer. Both devices operate with dual supplies of  $\pm 10V$  to  $\pm 36V$  or a single supply of  $+20V$  to  $+72V$ . Both devices can also operate with unbalanced supplies, such as  $+36V$  and  $-10V$ . These multiplexers support rail-to-rail input and output signals. The control logic level is defined via the EN input. These devices do not require power-supply sequencing. For input voltage steps larger than  $15V$ , the input-signal slew rate needs to be limited as described in the *Applications Information* section, otherwise the device can be damaged.

## Applications Information

### Current Through the Mux

The current flowing through each on-channel of the MAX14752/MAX14753 multiplexers must be limited to  $\pm 5mA$  for normal operation. If the current exceeds this limit, an internal leakage current from that channel to  $V_{SS}$  appears. Larger input current does not destroy the device if the max power dissipation is not exceeded.

### Signal's Slew-Rate Limit

If the input signal to the MAX14752/MAX14753 is a voltage step larger than  $15V$ , limit the slew rate of the signal according to the safe operating area specified in Figure 11. For input-voltage steps lower than  $15V$  (positive or negative), slew-rate limiting is not required. Slew-rate limiting can be achieved through a passive RC lowpass filter (see Figure 12). Do not use the input voltage steps beyond the safe operating area specified in the Figure 11 to avoid permanent damage to the device.

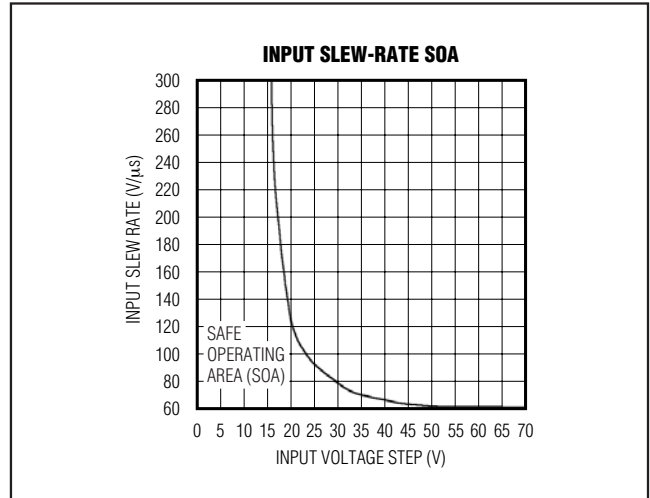

Figure 11. Safe Operating Area

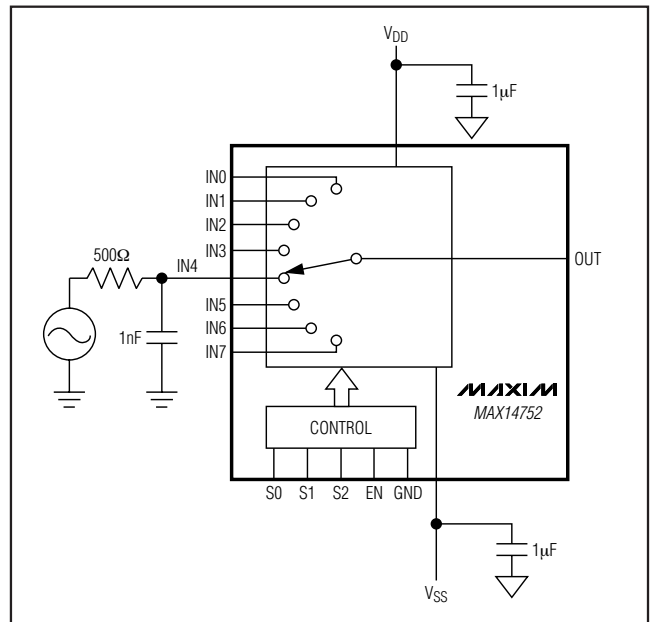

Figure 12. Input Slew-Rate Limit

## 8-Channel/Dual 4-Channel 72V Analog Multiplexers

### Input Voltage Clamping

For applications that require input voltages beyond the normal operating voltages, the internal input diodes to  $V_{DD}$  and  $V_{SS}$  can be used to limit the input voltages. As shown in Figure 13, series resistors can be employed at the inputs to limit the currents flowing into the diodes during undervoltage and overvoltage conditions. Choose the limiting resistors such that the input currents are limited to  $I_{IN\_}(max) = 100mA$ . The values of the current limit resistors can be calculated as the larger of  $R_{LIM+}$  and  $R_{LIM-}$ .

$$R_{LIM+} = \frac{V_{IN(max)} - V_{DD}}{I_{IN\_}(max)}$$

$$R_{LIM-} = \frac{V_{SS} - V_{IN(min)}}{I_{IN\_}(max)}$$

During an undervoltage or overvoltage condition, the input impedance is equal to  $R_{LIM}$ . The additional power dissipation due to the fault currents needs to be calculated. The MAX14752/MAX14753 multiplexer operates

normally on a channel that is on during an overvoltage or undervoltage clamping condition on a second channel that is not switched.

### Beyond-the-Rail Input

If input voltages are expected to go beyond the supply voltages, but within the absolute maximum supply voltages of the MAX14752/MAX14753, add two diodes in series with the supplies as shown in Figure 14.

During undervoltage and overvoltage events, the internal diodes pull  $V_{DD}/V_{SS}$  supplies up/down. An advantage of this scheme is that the input impedance is high and currents do not flow though the MAX14752/MAX14753 during overvoltage and undervoltage events. The input voltages must be limited to the voltages specified in the *Absolute Maximum Ratings* section.
