

General Description

The MAX4818/MAX4819 high-bandwidth, low-on-resistance analog dual SPDT switches/4:1 multiplexers are designed to serve as integrated T1/E1 protection switches for 1+1 and N+1 line-card redundancy applications. Each MAX4818/MAX4819 replaces four electromechanical relays, significantly reducing board space, simplifying PC board routing, and reducing power consumption. These devices operate with ±3.3V or ±5V dual supplies for applications requiring T1/E1 signal switching in the line side of the interface transformer. Internal voltage multipliers drive the analog switches, yielding excellent linearity and low 4Ω typical on-resistance within the T1/E1 analog signal range. This high-bandwidth family of products is optimized for low return loss and matched pulse template performance in T1/E1 long-haul and short-haul applications.

The MAX4818/MAX4819 are available in a tiny 16-pin. 5mm x 5mm, thin QFN package and are specified over the extended -40°C to +85°C temperature range.

Applications

T1/E1 Redundancy Switching

Base Stations and Base-Station Controllers

Add and Drop Multiplexers

Multi-Service Provisioning Platforms

Edge Routers

Multi-Service-Switches (MSSs)

Digital Loop Carriers

Industrial Applications

Data Acquisition

Telecom Signal Switching

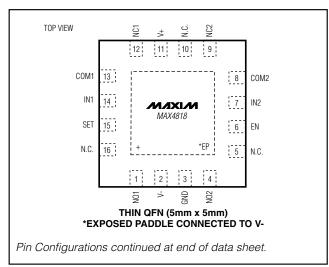

Test Equipment

Avionics

Features

- ♦ Dual SPDT and 4:1 Multiplexer Configurations
- ◆ Dual-Supply Operation from ±3.3V to ±5V
- ♦ Single-Supply Operation from +6V to +11V
- ♦ Hot-Insertion Tolerant with No DC Path to the **Supplies**
- ♦ Low On-Resistance, RoN = 4Ω (typ) and 6Ω (max)
- ♦ Over 350MHz -3dB Signal Bandwidth (MAX4818)
- **♦** Excellent Crosstalk and Off-Isolation Performance Over the T1/E1 Signal Spectrum: Over 110dB Crosstalk Attenuation at 1MHz (MAX4818)
- **♦** Low Current Consumption of 2mA (max)
- ♦ -40°C to +85°C Extended Temperature Range
- ♦ Space-Saving, 16-Pin, 5mm x 5mm Thin QFN
- ♦ SET Controls All Switches Simultaneously For Redundancy Switching (MAX4819)

Pin Configurations

Ordering Information

PART	TEMP RANGE	PIN-PACKAGE	CONFIGURATION	PACKAGE CODE
MAX4818ETE+	-40°C to +85°C	16 TQFN-EP*	2 x SPDT	T1655-3
MAX4819ETE+	-40°C to +85°C	16 TQFN-EP*	4:1 MUX	T1655-3

^{*}EP = Exposed Paddle

Devices are available in lead-free packages.

ABSOLUTE MAXIMUM RATINGS

(All voltages referenced to GND unless otl	nerwise noted.)
V+	0.3V to +6V
V	6V to +0.3V
V+ to V	0.3V to +12V
IN_, A0, A1, SET, EN	0.3V to $(V+) + 0.3V$
NO_, NC_, COM	12V to +12V
NO_, to COM_, NC_ to COM	18V to +18V
Continuous Current (NO_, NC_, COM_)	±100mA
Continuous Current (Any Other Terminal).	±30mA

Peak Current (NO_, NC_, COM_) (pulsed at 1ms, 10% duty cycle) Continuous Power Dissipation (T _A = +70°C)	
16-Pin Thin QFN 5mm x 5mm (derate 33.3n above T _A = +70°C)	
Operating Temperature Range	40°C to +85°C
Storage Temperature Range Junction Temperature	
Lead Temperature (soldering, 10s)	

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Detailed Description

The MAX4818/MAX4819 are each a high-bandwidth, low-on-resistance dual-SPDT analog switch/4:1 multiplexer, respectively. Both the MAX4818 and the MAX4819 are designed to serve as integrated T1/E1 analog protection switches for 1+1 and N+1 line-card redundancy applications. These devices replace electromechanical relays to save board space, reduce power consumption, and simplify PC board routing. The MAX4818/ MAX4819 allow the user to live insert the boards with no adverse effects.

The MAX4818/MAX4819 operate from $\pm 3.3 V$ or $\pm 5 V$ dual supplies, which are required for E1/T1 signal switching in the line-side of the interface transformer. Internal voltage multipliers supply the switches yielding excellent linearity and low on-resistance, typically 4Ω within the E1/T1 analog signal range. This high-bandwidth family of devices is optimized for low return loss

and matched pulse template performance in E1/T1 short-haul and long-haul applications.

Logic Inputs

The MAX4818 has four digital control inputs: EN, SET, IN1, and IN2. The EN input enables the switches. A logic 1 on SET connects COM to the NO_ terminal. IN_ controls the switch when SET is low, as shown in Table 1.

The MAX4819 has four digital control inputs: EN, SET, A1, and A0. The EN input enables the multiplexer. A logic 1 on SET connects all NO_ to COM. A1 and A0 control which terminal will be connected to COM when SET is low, as shown in Table 2.

Analog Signal Levels

The on-resistance of the MAX4818/MAX4819 is very low and stable as the analog signals are swept from V- to V+ (see the *Typical Operating Characteristics*).

Fault Protection

The fault protection of the MAX4818/MAX4819 allows the devices to handle input signals of more than twice the supply voltage without clamping the signal, latching up, or disturbing other cards in the system. The device detects when the input voltage drops below the negative supply. As soon as a fault condition is detected, the switch is immediately turned off for 128 clock cycles (typically 128µs). At the end of the 128µs timeout, the switch is turned back on for one clock cycle. At the end of the one clock cycle, if the signal is within the operating range, the switch will remain on. Otherwise, the device will turn the switch off again for 128 clock cycles. This will repeat until the signal is within the operating range. In T1/E1 redundancy applications, this can happen when the load resistor (RL) is removed or disconnected for any reason, as shown in Figure 1. Without a load resistor, the output voltage when using a 1:2 transformer can be as high as $\pm 11V$.

Hot Insertion

The MAX4818/MAX4819 tolerate hot insertions, thus are not damaged when inserted into a live backplane. Competing devices can exhibit low impedance when plugged into a live backplane that can cause high power dissipation leading to damage of the device itself. The MAX4818/MAX4819 have relatively high input impedance when V+ and V- supplies are unconnected or connected to GND. Therefore, the devices are not destroyed by a hot insertion. In order to guarrantee data integrity, the V+ and V- supplies must be properly biased.

Applications Information

T1/E1 N+1 Redundancy

Figures 6, 7, and 8 show a basic architecture for twisted-pair interface (120Ω , E1 or 100Ω , T1). Coaxial cable interface (75Ω , E1) can be illustrated with the same figures but without the single-ended to differential conversion stage. A single protection card can replace up to N line cards in a N+1 redundancy scheme. Figure 6 shows the switches sitting in the line cards where they can reroute any of the input/output signals to a protection line card. Figure 7 shows a "multiplexed" redundancy architecture using the MAX4819 where the multiplexers are in the line cards. This architecture is more scalable as the number of boards is increased. It also does not

(X = don't care.)

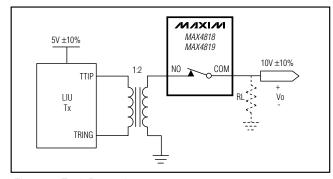

Figure 1. Fault Protection

require a dedicated external switching card as the multiplexers reside in the line cards themselves. The number of signals routed through the backplane is substantially higher than in the switching-card architecture. Figure 8 shows a similar architecture, but the multiplexers reside in the protection switching card. These figures do not show the surge-protection elements and resistors for line termination/impedance matching.

Test Circuits/Timing Diagrams

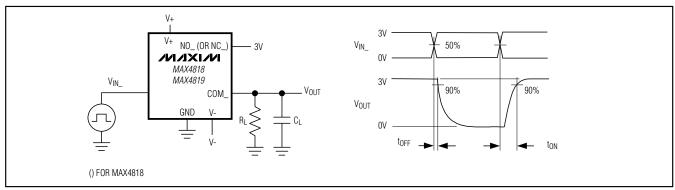

Figure 2. Switch Turn-On/Turn-Off Times

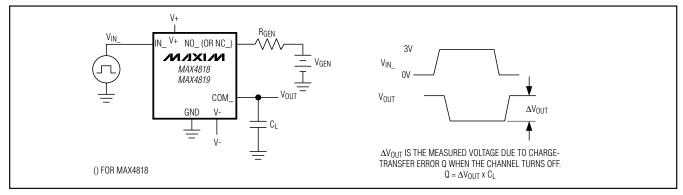

Figure 3. Charge Injection

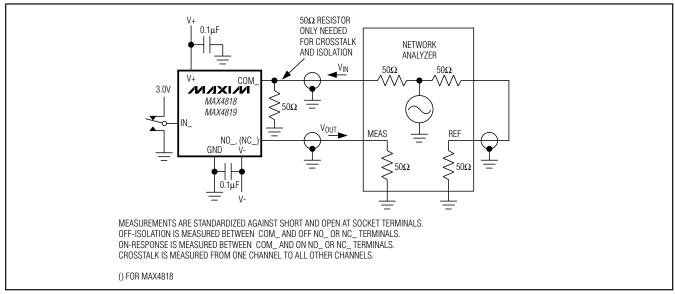

Figure 4. On-Loss, Off-Isolation, and Crosstalk

Test Circuits/Timing Diagrams (continued)

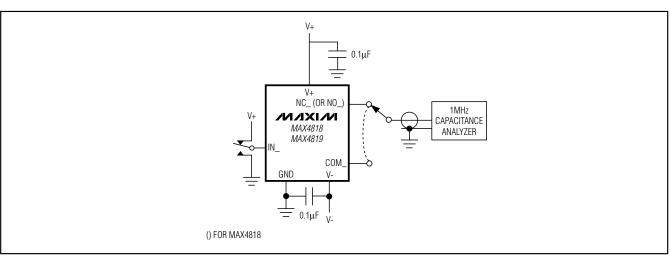

Figure 5. Channel Off-/On-Capacitance

The low on-resistance and high-bandwidth of the MAX4818/MAX4819 yield good pulse template and return-loss performance (see the *Typical Operating Characteristics*). The pulse template tests for E1 (twisted-pair interface 120Ω and coaxial interface 75Ω) and T1 (twisted-pair interface 100Ω) were tested using the Dallas DS2155 single-chip-transceiver evaluation board, and twelve switches in parallel with one switch closed and the other eleven open. The internal transmit

termination feature must be disable when using this circuit. In order to use the same transmit resistors for E1 twisted-pair and coaxial cables, the Transmit Line Buildout Control Register (TLBC) is set to the value 6Ah. This sets the driver voltage so the output pulse has the right amplitude for both 120 Ω (twisted pair) and 75 Ω (coaxial) loads. The analog switches were powered with dual power supplies at ±5V.

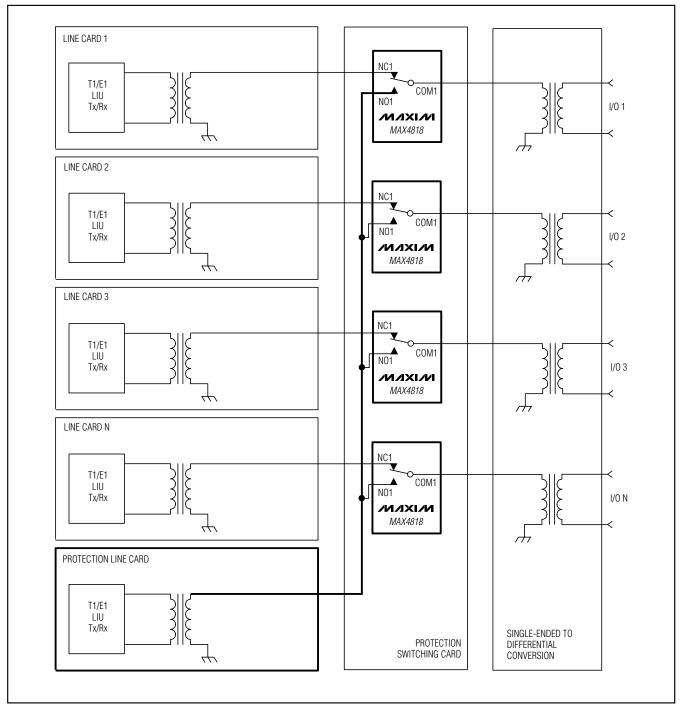

Figure 6. Switch Architecture for Twisted-Pair Cable (120 Ω , E1 or 100 Ω , T1). Same figure for Coaxial Cable (75 Ω , E1) without the single-ended-to-differential conversion.

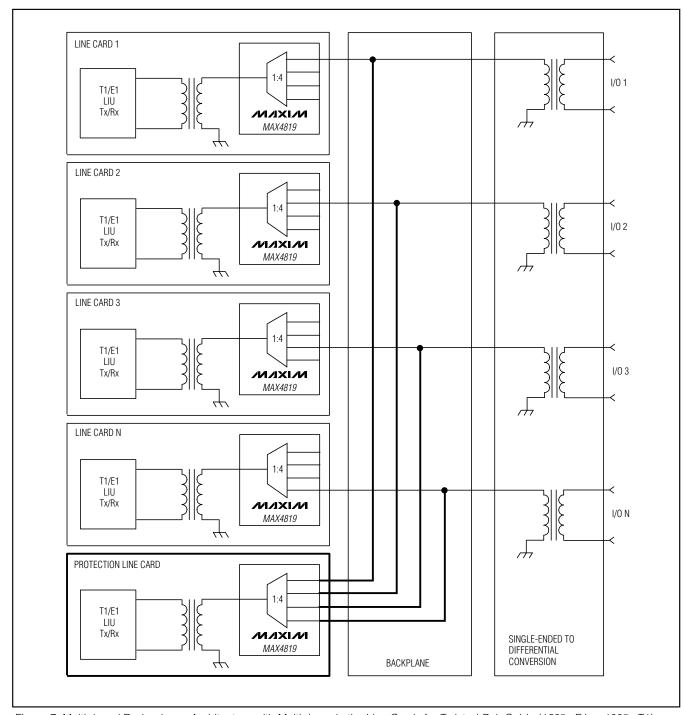

Figure 7. Multiplexed Redundancy Architecture with Multiplexer in the Line Cards for Twisted-Pair Cable (120 Ω , E1 or 100 Ω , T1). Same figure for coaxial cable (75 Ω , E1) without the single-ended-to-differential conversion.

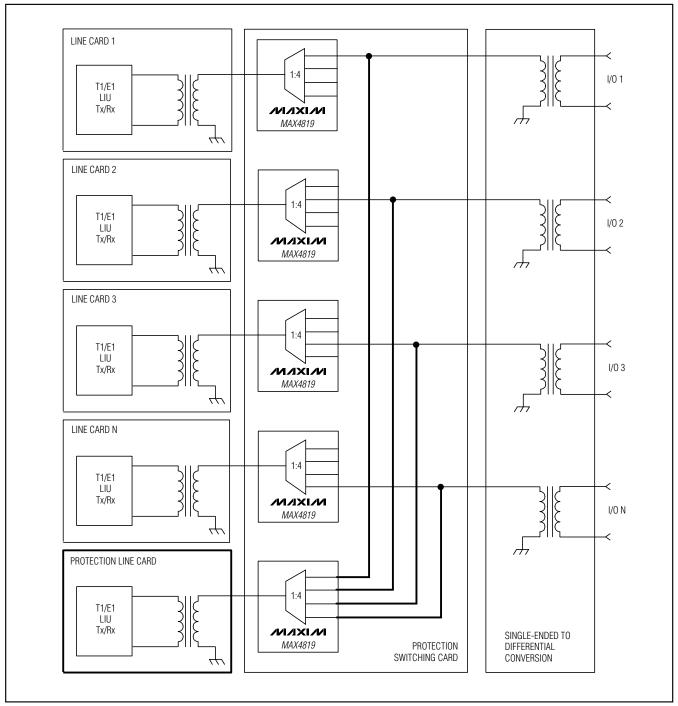

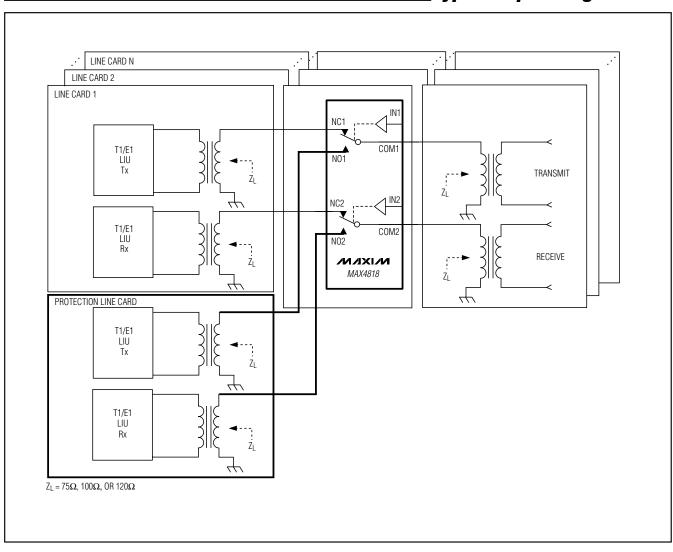

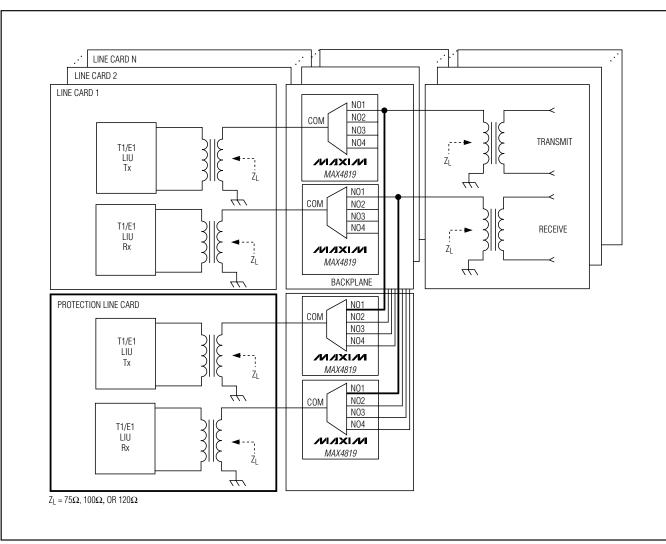

Figure 8. Multiplexed Redundancy Architecture with Multiplexer Out of the Line Cards for Twisted-Pair Cable (120 Ω , E1 or 100 Ω , T1). Same figure for coaxial cable (75 Ω , E1) without the single-ended-to-differential conversion.
