## Quad SPST CMOS Analog Switches

## General Description

The DG201A and DG211 are normally closed, quad single-pole single-throw (SPST) analog switches. These CMOS switches can be continuously operated with power supplies ranging from $\pm 4.5 \mathrm{~V}$ to $\pm 18 \mathrm{~V}$. Maxim guarantees that these switches will not latch up if the power supplies are disconnected with input signals still connected.

Both devices have guaranteed break-before-make switching. The DG201A differs from the DG211 primarily in switching speeds. The DG201A has a maximum turn-off time of 450 ns and a maximum turn-on time of 600ns. The DG211 has a maximum turn-off time of 500 ns and a maximum turn-on time of 1000 ns.
Compared to the original manufacturer's products, Maxim's DG201A and DG211 consume significantly lower power making them better suited for portable applications. Maxim has also eliminated the need for the third $\left(V_{L}\right)$ power supply that is required for the operation of the original manufacturer's DG211.

## Applications

Winchester Disk Drives
Test Equipment
Communications Systems
PBX, PABX
Guidance and Control Systems
Head Up Displays
Military Radios

Pin Configurations continued at end of data sheet.
Typical Operating Circuit

PROGRAMMABLE GAIN AMPLIFIER
NOTE: *PINS 1, 8, 9, AND 16 ARE LOGIC CONTROL INPUTS

Features

- Guaranteed $\pm 4.5 \mathrm{~V}$ to $\pm 18 \mathrm{~V}$ Operation
- No VL Supply Required
- Nonlatching with Supplies Turned Off and Input Signals Present
- CMOS and TTL Logic Compatible
- Monolithic, Low-Power CMOS Design

Ordering Information

| PART | TEMP RANGE | PIN-PACKAGE |
| :--- | :--- | :--- |
| DG201ACUE | $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ | 16 TSSOP |

(derate $19.2 \mathrm{~mW} /{ }^{\circ} \mathrm{C}$ above $+70^{\circ} \mathrm{C}$ )......................... 1538 mW

Note 1: Device mounted with all leads soldered to PC board.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## Switching Time Test Circuit

Switch output waveform shown for $V_{S}=$ constant with logic input waveform as shown. Note that $V_{S}$ may be + ve or -ve as per switching times test circuit. Vo is the steady state output with switch on. Feedthrough via gate capacitance may result in spikes at leading and trailing edge of output waveform.

## Quad SPST CMOS Analog Switches

| $\pm 15 \mathrm{~V}$ | - | - | $125 \Omega$ | $160 \Omega$ | $135 \Omega$ | $155 \Omega$ |

## Protecting Against Fault Conditions

Fault conditions occur when power supplies are turned off when input signals are still present, or when overvoltages occur at the inputs during normal operation. In either case, source-to-body diodes can be forward biased and conduct current from the signal source. If this current is required to be kept to low ( $\mu \mathrm{A}$ ) levels then the addition of external protection diodes is recommended.

To provide protection for overvoltages up to 20 V above the supplies, a 1N4001 or 1N914 type diode should be placed in series with the positive and negative supplies as shown in Figure 2. The addition of these diodes will reduce the analog signal range to 1 V below the positive supply and 1 V above the negative supply.

Figure 2. Protection against Fault Conditions
