

Low ON Resistance Triple, SP3T, Wide-Bandwidth Video Switch

Features

- Bi-directional operation
- 3x3 input/3output channels analog video switch
- Wide bandwidth 300MHz
- Low 4Ω switch resistance between two ports
- Excellent R_{ON} matching between channels
- Minimal propagation delay through the switch
- Low quiescent current consumption
- V_{CC} Operating Range: 4.0V to 5.5V
- Zero bounce in flow-through mode
- Control inputs compatible with TTL level
- Data and control inputs provide the undershoot clamp diode
- High ESD rating: > 2kV HBM
- -40°C to 85°C operating temperature range
- Suitable for both RGB and Component-Video Switching
- Available in a small TSSOP16 package

Applications

- Advanced TVs
- Front projectors
- LCD Monitors
- Notebook PCs
- DVD Players

Description

The STMAV335 is a bi-directional triple (3 channel) Single Pole/Triple Throw (SP3T) high-speed, low-power CMOS TTL-compatible analog video switch designed for advanced video applications which demand superior image quality. The low ON Resistance (R_{ON}) of the switch allows inputs to be connected to outputs without adding propagation delay or generating additional ground bounce noise.

STMAV335 is designed for very low cross-talk, low bit-to-bit skew, high channel-to-channel noise isolation and low I/O capacitance. The switch offers very little or practically no attenuation of the high-speed signals at the outputs, thus preserving the signal integrity to pass stringent requirements.

Moreover the device reduces the overall BOM costs by eliminating the need for more costly multi input-output controllers.

1 Summary Description

1.1 Functional Description

The STMAV335 is a high bandwidth analog video switch. Its low ON-resistance and low I/O capacitance result in a very small propagation delay.

The combination of SEL1 and SEL2 is used to either disable or enable the desired video channel. Refer to the truth table for the selection of the appropriate channels.

Table 1. Pin Description

Symbol	Type	Name and Functions
SEL1, SEL2	IN	Bus Switch Enable. Tie to V _{CC} through a pull-up resistor. The minimum value of the resistor is determined by the current-sinking capability of the driver.
Y/R, Pb/G, Pr/B	IN/OUT	Analog Video I/Os
Y1, Pb1, Pr1	IN/OUT	Component 1; Analog Video I/Os
Y2, Pb2, Pr2	IN/OUT	Component 2; Analog Video I/Os
R, G, B	IN/OUT	RGB or Component 3; Analog Video I/Os
V _{CC}		Power supply
GND		Ground

Table 2. Truth Table

SEL1	SEL2	Selection
0	0	Component = YPbPr1
0	1	Component = YPbPr2
1	0	Component = RGB
1	1	Switch disabled; external pull up resistor recommended

3.1 Power Supply Sequencing

Proper power-supply sequencing is advised for all CMOS devices. It is recommended to always apply V_{CC} before applying any signals to the input/output or control pins.

4 Maximum Ratings

Stressing the device above the rating listed in the “Absolute Maximum Ratings” table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

Table 3. Absolute Maximum Ratings

$T_A = 25^\circ\text{C}$, $V_{SS} = 0\text{V}$

Symbol	Parameter	Value	Unit
V_{CC}	Supply Voltage	-0.5 to + 7.0	V
V_S	DC Switch Voltage	-0.5 to + 7.0	V
V_{IN}	DC Input Voltage	-0.5 to + 7.0	V
I_{IK}	DC Input Diode Current	-50	mA
I_{OUT}	DC Output Sink Current	128	mA
I_{CC}/I_{GND}	DC V_{CC}/GND Current	± 100	mA
T_{STG}	Storage Temperature Range	-65 to 150	$^\circ\text{C}$

Note: Absolute maximum ratings are those values above which damage to the device may occur. Functional operation under these conditions is not implied. All voltages are referenced to GND.

Note: 1 CL includes probe and jig capacitance.

2 All input pulses are supplied by generators having the following characteristics: PRR ≤ 10MHz, ZO = 50Ω, tr, tf = 2.5ns.

3 The outputs are measured one at a time, with one transition per measurement.

Differential gain and phase are measured at the output of the ON channel. For example, when SEL1, SEL2 = 0 and Y is the input, the output is measured at Y1.

Figure 9. Differential Gain/Phase Measurement Test Circuit

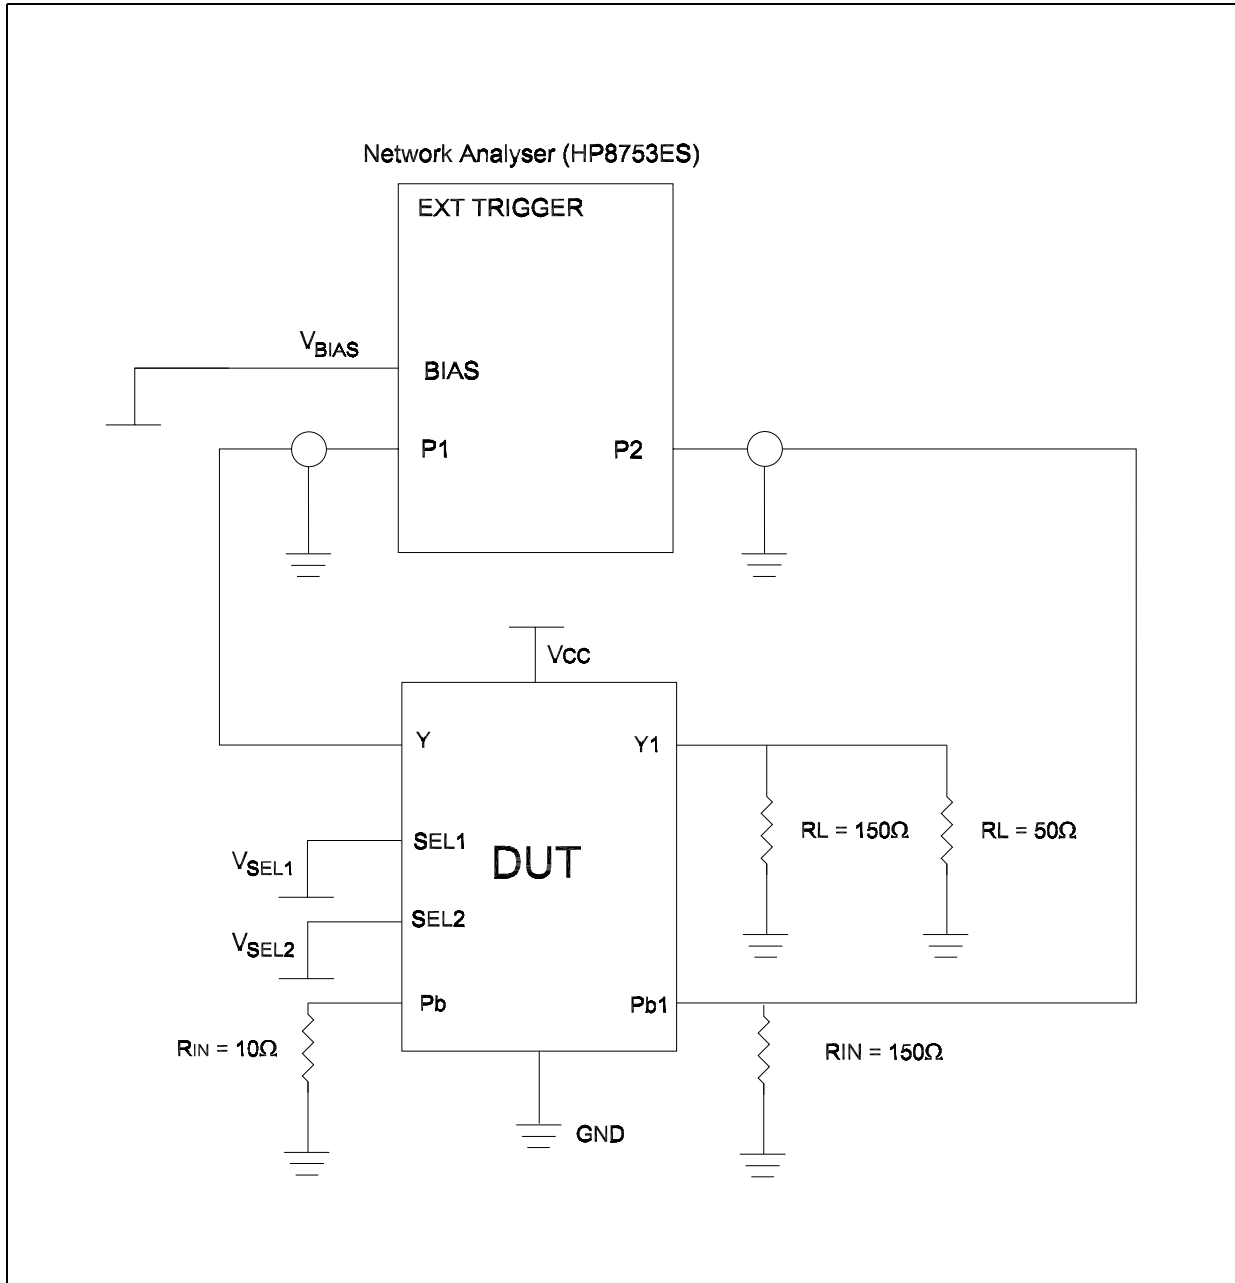

Frequency response is measured at the output of the ON channel. For example, when SEL1,SEL2 = 0, and Y is the input, the output is measured at Y1. All unused analog I/O ports are left open.

Figure 10. Test Circuit for frequency response (BW)

Crosstalk is measured at the output of the non-adjacent ON channel. For example, when SEL1,SEL2 = 0, and Y is the input, the output is measured at Pb1. All unused analog input ports (Pb,Pr) and output ports (PbX,PrX) are connected to GND through 10Ω and 50Ω pull-down resistors respectively.

Figure 11. Crosstalk Test Circuit

Note: 50Ω termination resistor is needed for the network analyzer.

Off-Isolation is measured at the output of the OFF channel. For example, when SEL1=0, SEL2=V_{CC}, and Y is the input, the output is measured at Y1. All unused analog input ports are left open, and output ports are connected to GND through 50Ω pull-down resistors.

8 Package Mechanical Data

In order to meet environmental requirements, ST offers these devices in ECOPACK[®] packages. These packages have a Lead-free second level interconnect . The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com.
