

# HIGH TEMPERATURE ADJUSTABLE PRECISION ZENER SHUNT REGULATOR

## ZHT2431

ISSUE 1 JULY 1997

### DEVICE DESCRIPTION

The ZHT2431 is a three terminal adjustable shunt regulator offering excellent temperature stability and output current handling capability up to 25mA. The output voltage may be set to any chosen voltage between 1.24 and 15 volts by selection of two external divider resistors.

The devices can be used as a replacement for zener diodes in many applications requiring an improvement in zener performance.

The ZHT2431 is particularly used in the feedback control loop of switch mode power supplies. In this application the device 1.24 volt reference enables the generation of low voltage supplies, typically 3.3 volts or 3 volts.

The ZHT2431 is intended for use over the extended operating range of -55°C to 125°C.

Deviation of reference input voltage, V<sub>dev</sub>, is defined as the maximum variation of the reference input voltage over the full temperature range.

The average temperature coefficient of the reference input voltage, V<sub>ref</sub> is defined as:

$$V_{ref} (ppm/^{\circ}C) = \frac{V_{dev} \times 1000000}{V_{ref} (T1 - T2)}$$

The dynamic output impedance, R<sub>Z</sub>, is defined as:

$$R_Z = \frac{\Delta V_Z}{\Delta I_Z}$$

When the device is programmed with two external resistors, R<sub>1</sub> and R<sub>2</sub>, (fig 2), the dynamic output impedance of the overall circuit, R', is defined as:

$$R' = R_Z \left( 1 + \frac{R1}{R2} \right)$$

† With a capacitance of greater than 100pF between cathode and anode, minimum cathode current must be 0.2mA.
