## High Performance Low-Power, LDO Regulator with Enable

The NCP600 provides 150 mA of output current at fixed voltage options, or an adjustable output voltage from 5.0 V down to 1.250 V. It is designed for portable battery powered applications and offers high performance features such as low power operation, fast enable response time, and low dropout.

The device is designed to be used with low cost ceramic capacitors and is packaged in the DFN6, 2x2.2 and TSOP-5 packages.

### Features

- Output Voltage Options:  
Adjustable, 1.3 V, 1.5 V, 1.8 V, 2.5 V, 2.8 V, 3.0 V, 3.3 V, 3.5 V, 5.0 V
- Ultra-Low Dropout Voltage of 150 mV at 150 mA
- Adjustable Output by External Resistors from 5.0 V down to 1.250 V
- Fast Enable Turn-on Time of 15  $\mu$ s
- Wide Supply Voltage Range Operating Range
- Excellent Line and Load Regulation
- High Accuracy up to 1.5% Output Voltage Tolerance over All Operating Conditions
- Typical Noise Voltage of 50  $\mu$ V<sub>rms</sub> without a Bypass Capacitor
- Pb-Free Package is Available

### Typical Applications

- SMPS Post-Regulation
- Hand-held Instrumentation
- Noise Sensitive Circuits – VCO, RF Stages, etc.
- Camcorders and Cameras

## PIN CONNECTIONS

\* ADJ – Adjustable Version  
NC – Fixed Voltage Version

Figure 2. Pin Connections – TSOP5

Figure 3. Pin Connections – DFN6

## PIN FUNCTION DESCRIPTION

Pin No.		Pin Name	Description
DFN6	TSOP-5		
3	4	ADJ/NC	Output Voltage Adjust Input (Adjustable Version), No Connection (Fixed Voltage Versions) (Note 1)
2, 5, EPAD	2	GND	Power Supply Ground; Device Substrate
4	3	ENABLE	The Enable Input places the device into low-power standby when pulled to logic low (< 0.4 V). Connect to $V_{in}$ if the function is not used.
6	1	$V_{in}$	Positive Power Supply Input
1	5	$V_{out}$	Regulated Output Voltage

1. True no connect. Printed circuit board traces are allowable.

## ABSOLUTE MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Input Voltage Range (Note 2)	$V_{in}$	-0.3 to 6.5	V
Output, Enable, Adjustable Voltage Range	$V_{out}$ , ENABLE, ADJ	-0.3 to 6.5 (or $V_{in} + 0.3$ ) Whichever is Lower	V
Maximum Junction Temperature	$T_{J(max)}$	150	°C
Storage Temperature Range	$T_{STG}$	-65 to 150	°C
ESD Capability, Human Body Model (Note 3)	ESD <sub>HBM</sub>	3500	V
ESD Capability, Machine Model (Note 3)	ESD <sub>MM</sub>	400	V
Moisture Sensitivity Level	MSL	MSL1/260	-

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

2. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.

3. This device series incorporates ESD protection and is tested by the following methods:

ESD Human Body Model tested per AEC-Q100-002 (EIA/JESD22-A114)

ESD Machine Model tested per AEC-Q100-003 (EIA/JESD22-A115)

Latchup Current Maximum Rating:  $\leq 150$  mA per JEDEC standard: JESD78.

## THERMAL CHARACTERISTICS

Rating	Symbol	Value	Unit
Thermal Characteristics, DFN6, 2x2.2 mm (Note 4) Thermal Resistance, Junction-to-Air (Note 5)	$R_{\theta JA}$	122	°C/W
Thermal Characteristics, TSOP-5 (Note 4) Thermal Resistance, Junction-to-Air (Note 5)	$R_{\theta JA}$	215	°C/W

4. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.

5. Values based on copper area of 645 mm<sup>2</sup>, 1 oz copper thickness.

## OPERATING RANGES (Note 6)

Rating	Symbol	Min	Max	Unit
Operating Input Voltage (Note 7)	$V_{in}$	1.75 V	6	V
Adjustable Output Voltage (Adjustable Version Only)	$V_{out}$	1.25	5.0	V
Output Current	$I_{out}$	0	150	mA
Ambient Temperature	$T_A$	-40	125	°C

6. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.

7. Minimum  $V_{in} = 1.75$  V or ( $V_{out} + V_{DO}$ ), whichever is higher.

## DEFINITIONS

### Load Regulation

The change in output voltage for a change in output load current at a constant temperature.

### Dropout Voltage

The input/output differential at which the regulator output no longer maintains regulation against further reductions in input voltage. Measured when the output drops 2% below its nominal. The junction temperature, load current, and minimum input supply requirements affect the dropout level.

### Output Noise Voltage

This is the integrated value of the output noise over a specified frequency range. Input voltage and output load current are kept constant during the measurement. Results are expressed in  $\mu\text{V}_{\text{rms}}$  or  $\text{nV}/\sqrt{\text{Hz}}$ .

### Disable and Ground Current

Ground Current ( $I_{\text{GND}}$ ) is the current that flows through the ground pin when the regulator operates with a load on its output. This consists of internal IC operation, bias, etc. It is actually the difference between the input current (measured through the LDO input pin) and the output load current. If the regulator has an input pin that reduces its internal bias and shuts off the output (enable/disable function), this term is called the disable current ( $I_{\text{DIS}}$ ).

### Line Regulation

The change in output voltage for a change in input voltage. The measurement is made under conditions of low dissipation or by using pulse techniques such that the average junction temperature is not significantly affected.

### Line Transient Response

Typical output voltage overshoot and undershoot response when the input voltage is excited with a given slope.

### Load Transient Response

Typical output voltage overshoot and undershoot response when the output current is excited with a given slope between no-load and full-load conditions.

### Thermal Protection

Internal thermal shutdown circuitry is provided to protect the integrated circuit in the event that the maximum junction temperature is exceeded. When activated at typically 175°C, the regulator turns off. This feature is provided to prevent failures from accidental overheating.

### Maximum Package Power Dissipation

The power dissipation level at which the junction temperature reaches its maximum operating value.

## APPLICATIONS INFORMATION

The NCP600 series regulator is self-protected with internal thermal shutdown and internal current limit. Typical application circuits are shown in Figures 4 and 5.

### Input Decoupling ( $C_{\text{in}}$ )

A ceramic or tantalum 1.0  $\mu\text{F}$  capacitor is recommended and should be connected close to the NCP600 package. Higher capacitance and lower ESR will improve the overall line transient response.

### Output Decoupling ( $C_{\text{out}}$ )

The NCP600 is a stable component and does not require a minimum Equivalent Series Resistance (ESR) for the output capacitor. The minimum output decoupling value is 1.0  $\mu\text{F}$  and can be augmented to fulfill stringent load transient requirements. The regulator works with ceramic chip capacitors as well as tantalum devices. Larger values improve noise rejection and load regulation transient response. Figure 30 shows the stability region for a range of operating conditions and ESR values.

### No-Load Regulation Considerations

The NCP600 adjustable regulator will operate properly under conditions where the only load current is through the resistor divider that sets the output voltage. However, in the case where the NCP600 is configured to provide a 1.250 V

output, there is no resistor divider. If the part is enabled under no-load conditions, leakage current through the pass transistor at junction temperatures above 85°C can approach several microamps, especially as junction temperature approaches 150°C. If this leakage current is not directed into a load, the output voltage will rise up to a level approximately 20 mV above nominal.

The NCP600 contains an overshoot clamp circuit to improve transient response during a load current step release. When output voltage exceeds the nominal by approximately 20 mV, this circuit becomes active and clamps the output from further voltage increase. Tying the ENABLE pin to  $V_{\text{in}}$  will ensure that the part is active whenever the supply voltage is present, thus guaranteeing that the clamp circuit is active whenever leakage current is present.

When the NCP600 adjustable regulator is disabled, the overshoot clamp circuit becomes inactive and the pass transistor leakage will charge any capacitance on  $V_{\text{out}}$ . If no load is present, the output can charge up to within a few millivolts of  $V_{\text{in}}$ . In most applications, the load will present some impedance to  $V_{\text{out}}$  such that the output voltage will be inherently clamped at a safe level. A minimum load of 10  $\mu\text{A}$  is recommended.

# NCP600

## Noise Decoupling

The NCP600 is a low noise regulator and needs no external noise reduction capacitor. Unlike other low noise regulators which require an external capacitor and have slow startup times, the NCP600 operates without a noise reduction capacitor, has a typical 15  $\mu$ s start up delay and achieves a 50  $\mu$ V<sub>rms</sub> overall noise level between 10 Hz and 100 kHz.

## Enable Operation

The enable pin will turn the regulator on or off. The threshold limits are covered in the electrical characteristics table in this data sheet. The turn-on/turn-off transient voltage being supplied to the enable pin should exceed a slew rate of 10 mV/ $\mu$ s to ensure correct operation. If the enable function is not to be used then the pin should be connected to V<sub>in</sub>.

## Output Voltage Adjust

The output voltage can be adjusted from 1 times (Figure 4) to 4 times (Figure 5) the typical 1.250 V regulation voltage via the use of resistors between the output and the ADJ input. The output voltage and resistors are chosen using Equation 1 and Equation 2.

$$V_{out} = 1.250 \left( 1 + \frac{R_1}{R_2} \right) + (I_{ADJ} \times R_1) \quad (\text{eq. 1})$$

$$R_2 \cong \frac{R_1}{\frac{V_{out}}{1.25} - 1} \quad (\text{eq. 2})$$

Input bias current I<sub>ADJ</sub> is typically less than 150 nA. Choose R2 arbitrarily to minimize errors due to the bias current and to minimize noise contribution to the output voltage. Use Equation 2 to find the required value for R1.

## Thermal

As power in the NCP600 increases, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and the ambient temperature affect the rate of junction temperature rise for the part. When the NCP600 has good thermal conductivity through the PCB, the junction temperature will be relatively low with high power applications. The maximum dissipation the NCP600 can handle is given by:

$$P_{D(MAX)} = \frac{T_{J(MAX)} - T_A}{R_{\theta JA}} \quad (\text{eq. 3})$$

Since T<sub>J</sub> is not recommended to exceed 125°C (T<sub>J(MAX)</sub>), then the NCP600 in a DFN6 package can dissipate up to 870 mW when the ambient temperature (T<sub>A</sub>) is 25°C, and PCB area is 640 mm<sup>2</sup> and larger, see Figure 33.

The power dissipated by the NCP600 can be calculated from the following equations:

$$P_D \approx V_{in}(I_{GND} @ I_{out}) + I_{out}(V_{in} - V_{out}) \quad (\text{eq. 4})$$

or

$$V_{in(MAX)} \approx \frac{P_{D(MAX)} + (V_{out} \times I_{out})}{I_{out} + I_{GND}} \quad (\text{eq. 5})$$

Figure 33. R<sub>thJA</sub> vs. PCB Copper Area

## Hints

V<sub>in</sub> and GND printed circuit board traces should be as wide as possible. When the impedance of these traces is high, there is a chance to pick up noise or cause the regulator to malfunction. Place external components, especially the output capacitor, as close as possible to the NCP600, and make traces as short as possible.
