

# NCP631

## 3.0 A Linear Voltage Regulator with Soft-Start

The NCP631 is a low dropout positive voltage regulator that is capable of providing a guaranteed output current of 3.0 A with a maximum dropout voltage of 1.25 V at 3.0 A over temperature. The NCP631 is currently offered as a fixed voltage version at 3.47 V. On chip trimming adjusts the reference/output voltage to within  $\pm 1.5\%$  accuracy. The Soft-Start function allows control of start up times. This prevents current spikes at start up due to output capacitor in-rush current. Internal protection features consist of output foldback current limiting, and thermal shutdown. The NCP631 is available in D<sup>2</sup>PAK package.

### Features

- Output Current of 3.0 A
- 1.25 V Maximum Dropout Voltage at 3.0 A Over Temperature
- Voltage on Shutdown Pin is TTL compatible
- Reference/Output Voltage Trimmed to  $\pm 1.5\%$
- Current Limit Protection
- Thermal Shutdown Protection
- 0°C to 125°C Junction Temperature Range
- Pb-Free Packages are Available

### Applications

- Microprocessor Power Supplies
- SMPS Post Regulation
- Battery Chargers
- DSP Power Supplies

## PIN DESCRIPTION

Pin No.	Symbol	Description
1	Shutdown	This input is used to place the NCP631 into shutdown mode. The NCP631 is active when a voltage greater than 2.0 V is applied. The NCP631 will be placed into a shutdown mode when a voltage less than 0.8 V is applied. If left unused then connect the pin high.
2	$V_{in}$	Positive Power Supply Input Voltage
3, Tab	Ground	Power Supply Ground
4	$V_{out}$	Regulated Output Voltage
5	Soft-Start	Soft-Start capacitor is placed from this pin to ground. Refer to applications information section on Page 6 for proper capacitor selection.

## MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Input Voltage (Note 1)	$V_{in}$	9.0	V
Shutdown Voltage	Enable	-0.3 to 7	V
Output Voltage	$V_{out}$	-0.3 to $V_{in} + 0.3$	V
Power Dissipation and Thermal Characteristics Case 936A (D <sup>2</sup> PAK) Power Dissipation (Note 2) Thermal Resistance, Junction-to-Ambient Thermal Resistance, Junction-to-Case	$P_D$ $R_{\theta JA}$ $R_{\theta JC}$	Internally Limited 45 5.0	W °C/W °C/W
Operating Junction Temperature Range	$T_J$	-40 to 125	°C
Storage Temperature Range	$T_{stg}$	-55 to 150	°C

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. This device series contains ESD protection and exceeds the following tests:

Human Body Model JESD 22-A114-B

Machine Model JESD 22-A115-A

2. The maximum package power dissipation is:

$$PD = \frac{T_J(\max) - T_A}{R_{\theta JA}}$$

Soft-Start Pin Current	$I_{SS}$	–	11	–	$\mu\text{A}$

3. Low duty cycle pulse techniques are used during testing to maintain the junction temperature as close to ambient as possible.
4. Line regulation is defined as the change in output voltage for a change in input voltage. Load regulation is defined as the change in output voltage for a change in output load current at a constant temperature. The limits for line and load regulation are contained within the reference voltage specification,  $V_{adj}$ . Typical numbers are included in the specification for line and load regulation.

APPLICATIONS INFORMATION

**Input Capacitor**

The minimum capacitance required for stability is a 68 μF aluminum electrolytic or tantalum capacitor. The maximum ESR allowed for stability is 5.0 Ω. The capacitor should be placed as close as possible to the input of the device.

The placement of a ceramic capacitor in parallel is not recommended due to possible instabilities.

**Output Capacitor**

A minimum output capacitor value of 33 μF is required for stability. The type of capacitor can be aluminum electrolytic or tantalum capacitor. ESR can vary up to a maximum of 2.0 Ω for stability. The capacitor should be placed as close as possible to the output of the device.

The placement of a ceramic capacitor in parallel is not recommended due to possible instabilities.

**Soft-Start Function**

Slope of the output voltage during startup (Shutdown pin goes from low to high) can be adjusted by value of Cs capacitor. The basic formula for this function is:

$$\frac{dV}{dt} = \frac{I_{SS}}{C_s} = \frac{I_{out}}{C_{out}} * \frac{V_{ref}}{V_{out}} \quad (\text{eq. 1})$$

Where:

$$\begin{aligned} I_{SS} &= 11 \mu\text{A} \\ C_s &= 10 \text{ nF (typ)} \\ V_{ref} &= 1.2 \text{ V} \\ V_{out} &= 3.47 \text{ V} \end{aligned} \quad (\text{eq. 2})$$

Output current limitation during start-up:

$$I_{out} = \left( \frac{V_{out}}{V_{ref}} \right) * C_{out} * \frac{I_{SS}}{C_s} \quad (\text{eq. 3})$$

An example for C<sub>out</sub> = 500 μF, C<sub>s</sub> = 10 nF:

$$I_{out} = \left( \frac{3.47}{1.2} \right) * 500\text{E} - 6 * \frac{11\text{E} - 6}{10\text{E} - 9} = 1.59 \text{ A} \quad (\text{eq. 4})$$

Time when the output voltage will reach target value can be determined by:

$$T_s = V_{ref} * \frac{C_s}{I_{SS}} \quad (\text{eq. 5})$$

An example for C<sub>s</sub> = 10 nF:

$$T_s = 1.2 * \frac{10\text{E} - 9}{11\text{E} - 6} = 1.09 \text{ ms} \quad (\text{eq. 6})$$

Figure 13. Typical Soft-Start Condition

# NCP631

## Reverse Current

Some situations might occur where the output pin is raised to a voltage while the input pin is at zero volts. This situation will not damage the device.

If the output voltage is raised to a higher voltage than the input voltage a diode is recommended from output to input with the anode connect to the output pin.

## Thermal Considerations

This series contains an internal thermal limiting circuit that is designed to protect the regulator in the event that the maximum junction temperature is exceeded. When activated, typically at 155°C, the regulator output switches off and then back on as the die cools. As a result, if the device is continuously operated in an overheated condition, the output will appear to be oscillating. This feature provides protection from a catastrophic device failure due to accidental overheating. It is not intended to be used as a

substitute for proper heatsinking. The maximum device power dissipation can be calculated by:

$$P_D = \frac{T_{J(max)} - T_A}{R_{\theta JA}} \quad (\text{eq. 7})$$

The devices are available in surface mount D<sup>2</sup>PAK package. The package has an exposed metal tab that is specifically designed to reduce the junction to air thermal resistance, R<sub>θJA</sub>, by utilizing the printed circuit board copper as a heat dissipater. Figure 13 shows typical R<sub>θJA</sub> values that can be obtained from a square pattern using economical single sided 2.0 ounce copper board material. The final product thermal limits should be tested and quantified in order to insure acceptable performance and reliability. The actual R<sub>θJA</sub> can vary considerably from the graphs shown. This will be due to any changes made in the copper aspect ratio of the final layout, adjacent heat sources, and air flow.
