

LM2717

Dual Step-Down DC/DC Converter

General Description

The LM2717 is composed of two PWM DC/DC buck (step-down) converters. The first converter is used to generate a fixed output voltage of 3.3V. The second converter is used to generate an adjustable output voltage. Both converters feature low $R_{DS(ON)}$ (0.16 Ω) internal switches for maximum efficiency. Operating frequency can be adjusted anywhere between 300kHz and 600kHz allowing the use of small external components. External soft-start pins for each enables the user to tailor the soft-start times to a specific application. Each converter may also be shut down independently with its own shutdown pin. The LM2717 is available in a low profile 24-lead TSSOP package ensuring a low profile overall solution.

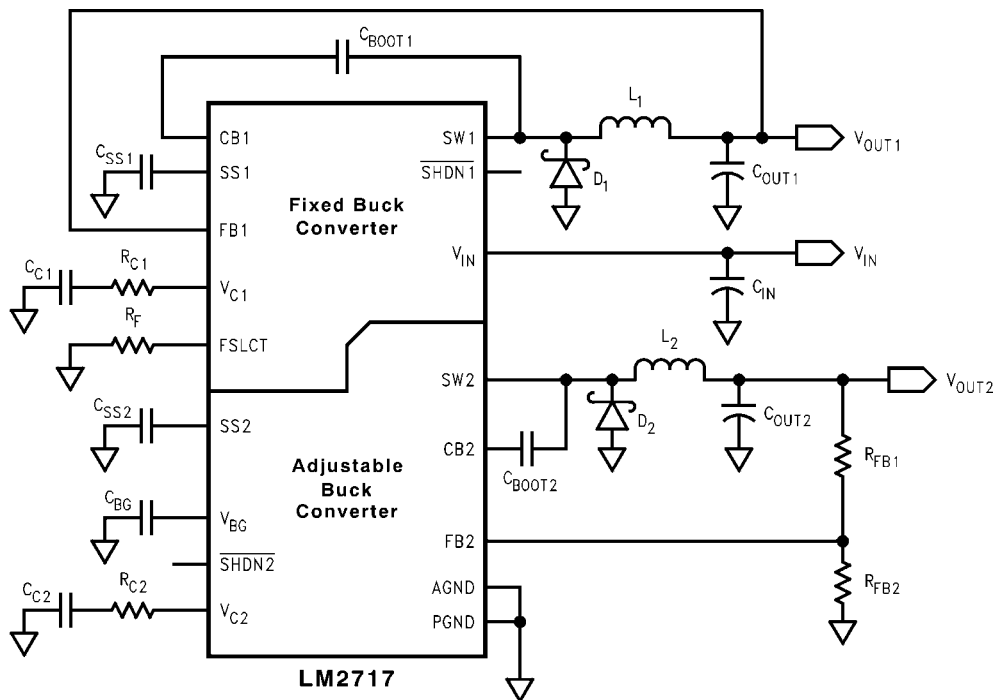

Features

- Fixed 3.3V output buck converter with a 2.2A, 0.16 Ω , internal switch
- Adjustable buck converter with a 3.2A, 0.16 Ω , internal switch
- Operating input voltage range of 4V to 20V
- Input undervoltage protection
- 300kHz to 600kHz pin adjustable operating frequency
- Over temperature protection
- Small 24-Lead TSSOP package

Applications

- TFT-LCD Displays
- Handheld Devices
- Portable Applications
- Laptop Computers

Typical Application Circuit

20078501

Connection Diagram

Ordering Information

Order Number	Spec	Package Type	NSC Package Drawing	Supplied As
LM2717MT		TSSOP-24	MTC24	61 Units, Rail
LM2717MTX		TSSOP-24	MTC24	2500 Units, Tape and Reel
LM2717MT	NOPB	TSSOP-24	MTC24	61 Units, Rail
LM2717MTX	NOPB	TSSOP-24	MTC24	2500 Units, Tape and Reel

Pin Descriptions

Pin	Name	Function
1	PGND	Power ground. PGND and AGND pins must be connected together directly at the part.
2	PGND	Power ground. PGND and AGND pins must be connected together directly at the part.
3	AGND	Analog ground. PGND and AGND pins must be connected together directly at the part.
4	FB1	Fixed buck output voltage feedback input.
5	V _{C1}	Fixed buck compensation network connection. Connected to the output of the voltage error amplifier.
6	V _{BG}	Bandgap connection.
7	V _{C2}	Adjustable buck compensation network connection. Connected to the output of the voltage error amplifier.
8	FB2	Adjustable buck output voltage feedback input.
9	AGND	Analog ground. PGND and AGND pins must be connected together directly at the part.
10	AGND	Analog ground. PGND and AGND pins must be connected together directly at the part.
11	PGND	Power ground. PGND and AGND pins must be connected together directly at the part.
12	PGND	Power ground. PGND and AGND pins must be connected together directly at the part.
13	SW2	Adjustable buck power switch input. Switch connected between V _{IN} pins and SW2 pin.
14	V _{IN}	Analog power input. V _{IN} pins should be connected together directly at the part.
15	V _{IN}	Analog power input. V _{IN} pins should be connected together directly at the part.
16	CB2	Adjustable buck converter bootstrap capacitor connection.
17	$\overline{\text{SHDN2}}$	Shutdown pin for adjustable buck converter. Active low.
18	SS2	Adjustable buck soft start pin.
19	FSLCT	Switching frequency select input. Use a resistor to set the frequency anywhere between 300kHz and 600kHz.
20	SS1	Fixed buck soft start pin.
21	$\overline{\text{SHDN1}}$	Shutdown pin for fixed buck converter. Active low.
22	CB1	Fixed buck converter bootstrap capacitor connection.
23	V _{IN}	Analog power input. V _{IN} pins should be connected together directly at the part.
24	SW1	Fixed buck power switch input. Switch connected between V _{IN} pins and SW1 pin.

Absolute Maximum Ratings (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

V_{IN}	-0.3V to 22V
SW1 Voltage	-0.3V to 22V
SW2 Voltage	-0.3V to 22V
FB1, FB2 Voltages	-0.3V to 7V
CB1, CB2 Voltages	-0.3V to $V_{IN}+7V$ ($V_{IN}=V_{SW}$)
V_{C1} Voltage	$1.75V \leq V_{C1} \leq 2.25V$
V_{C2} Voltage	$0.965V \leq V_{C2} \leq 1.565V$
$\overline{SHDN1}$ Voltage	-0.3V to 7.5V
$\overline{SHDN2}$ Voltage	-0.3V to 7.5V
SS1 Voltage	-0.3V to 2.1V
SS2 Voltage	-0.3V to 2.1V

FSLCT Voltage	AGND to 5V
Maximum Junction Temperature	150°C
Power Dissipation(Note 2)	Internally Limited
Lead Temperature	300°C
Vapor Phase (60 sec.)	215°C
Infrared (15 sec.)	220°C
ESD Susceptibility (Note 3)	
Human Body Model	2kV

Operating Conditions

Operating Junction Temperature Range (Note 4)	-40°C to +125°C
Storage Temperature	-65°C to +150°C
Supply Voltage	4V to 20V
SW1 Voltage	20V
SW2 Voltage	20V

Electrical Characteristics

Specifications in standard type face are for $T_J = 25^\circ\text{C}$ and those with **boldface type** apply over the full **Operating Temperature Range** ($T_J = -40^\circ\text{C}$ to $+125^\circ\text{C}$). $V_{IN} = 5V$, $I_L = 0A$, and $F_{SW} = 300\text{kHz}$ unless otherwise specified.

Symbol	Parameter	Conditions	Min (Note 4)	Typ (Note 5)	Max (Note 4)	Units
I_Q	Total Quiescent Current (both switchers)	Not Switching		2.7	6	mA
		Switching, switch open		6	12	mA
		$V_{\overline{SHDN}} = 0V$		9	27	μA
V_{FB1}	Fixed Buck Feedback Voltage			3.3		V
V_{FB2}	Adjustable Buck Feedback Voltage			1.267		V
I_{CL1} (Note 6)	Fixed Buck Switch Current Limit	$V_{IN} = 8V$ (Note 7)		2.2		A
I_{CL2} (Note 6)	Adjustable Buck Switch Current Limit	$V_{IN} = 8V$ (Note 7)		3.2		A
I_{B1}	Fixed Buck FB Pin Bias Current (Note 8)	$V_{IN} = 20V$		65		μA
I_{B2}	Adjustable Buck FB Pin Bias Current (Note 8)	$V_{IN} = 20V$		65		nA
V_{IN}	Input Voltage Range		4		20	V
g_{m1}	Fixed Buck Error Amp Transconductance	$\Delta I = 20\mu\text{A}$		1340		μmho
g_{m2}	Adjustable Buck Error Amp Transconductance	$\Delta I = 20\mu\text{A}$		1360		μmho
A_{V1}	Fixed Buck Error Amp Voltage Gain			134		V/V
A_{V2}	Adjustable Buck Error Amp Voltage Gain			136		V/V
D_{MAX}	Maximum Duty Cycle		89	93		%
F_{SW}	Switching Frequency	$R_F = 46.4\text{k}$	200	300	400	kHz
		$R_F = 22.6\text{k}$	475	600	775	kHz
$I_{\overline{SHDN1}}$	Fixed Buck Shutdown Pin Current	$0V < V_{\overline{SHDN1}} < 7.5V$	-5		5	μA
$I_{\overline{SHDN2}}$	Adjustable Buck Shutdown Pin Current	$0V < V_{\overline{SHDN2}} < 7.5V$	-5		5	μA

Symbol	Parameter	Conditions	Min (Note 4)	Typ (Note 5)	Max (Note 4)	Units
I_{L1}	Fixed Buck Switch Leakage Current	$V_{IN} = 20V$		0.01	5	μA
I_{L2}	Adjustable Buck Switch Leakage Current	$V_{IN} = 20V$		0.01	5	μA
R_{DSON1}	Fixed Buck Switch R_{DSON} (Note 9)			160		$m\Omega$
R_{DSON2}	Adjustable Buck Switch R_{DSON} (Note 9)			160		$m\Omega$
Th_{SHDN1}	Fixed Buck SHDN Threshold	Output High	1.8	1.36		V
		Output Low		1.33	0.7	
Th_{SHDN2}	Adjustable Buck \overline{SHDN} Threshold	Output High	1.8	1.36		V
		Output Low		1.33	0.7	
I_{SS1}	Fixed Buck Soft Start Pin Current		4	9	15	μA
I_{SS2}	Adjustable Buck Soft Start Pin Current		4	9	15	μA
UVP	On Threshold		4	3.8		V
	Off Threshold			3.6	3.3	
θ_{JA}	Thermal Resistance (Note 10)	TSSOP, package only		115		$^{\circ}C/W$

Note 1: Absolute maximum ratings are limits beyond which damage to the device may occur. Operating Ratings are conditions for which the device is intended to be functional, but device parameter specifications may not be guaranteed. For guaranteed specifications and test conditions, see the Electrical Characteristics.

Note 2: The maximum allowable power dissipation is a function of the maximum junction temperature, $T_J(MAX)$, the junction-to-ambient thermal resistance, θ_{JA} , and the ambient temperature, T_A . See the Electrical Characteristics table for the thermal resistance. The maximum allowable power dissipation at any ambient temperature is calculated using: $P_D(MAX) = (T_J(MAX) - T_A)/\theta_{JA}$. Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown.

Note 3: The human body model is a 100 pF capacitor discharged through a 1.5k Ω resistor into each pin.

Note 4: All limits guaranteed at room temperature (standard typeface) and at temperature extremes (bold typeface). All room temperature limits are 100% tested or guaranteed through statistical analysis. All limits at temperature extremes are guaranteed via correlation using standard Statistical Quality Control (SQC) methods. All limits are used to calculate Average Outgoing Quality Level (AOQL).

Note 5: Typical numbers are at 25 $^{\circ}C$ and represent the most likely norm.

Note 6: Duty cycle affects current limit due to ramp generator.

Note 7: Current limit at 0% duty cycle. See *TYPICAL PERFORMANCE* section for Switch Current Limit vs. V_{IN} .

Note 8: Bias current flows into FB pin.

Note 9: Includes the bond wires, R_{DSON} from V_{IN} pin(s) to SW pin.

Note 10: Refer to National's packaging website for more detailed thermal information and mounting techniques for the TSSOP package.

Buck Operation

PROTECTION (BOTH REGULATORS)

The LM2717 has dedicated protection circuitry running during normal operation to protect the IC. The Thermal Shutdown circuitry turns off the power devices when the die temperature reaches excessive levels. The UVP comparator protects the power devices during supply power startup and shutdown to prevent operation at voltages less than the minimum input voltage. The OVP comparator is used to prevent the output voltage from rising at no loads allowing full PWM operation over all load conditions. The LM2717 also features a shutdown mode for each converter decreasing the supply current to approximately 10 μ A (both in shutdown mode).

CONTINUOUS CONDUCTION MODE

The LM2717 contains current-mode, PWM buck regulators. A buck regulator steps the input voltage down to a lower output voltage. In continuous conduction mode (when the inductor current never reaches zero at steady state), the buck regulator operates in two cycles. The power switch is connected between V_{IN} and SW1 and SW2.

In the first cycle of operation the transistor is closed and the diode is reverse biased. Energy is collected in the inductor and the load current is supplied by C_{OUT} and the rising current through the inductor.

During the second cycle the transistor is open and the diode is forward biased due to the fact that the inductor current cannot instantaneously change direction. The energy stored in the inductor is transferred to the load and output capacitor.

The ratio of these two cycles determines the output voltage. The output voltage is defined approximately as:

$$D = \frac{V_{OUT}}{V_{IN}}, D' = (1-D)$$

where D is the duty cycle of the switch, D and D' will be required for design calculations.

DESIGN PROCEDURE

This section presents guidelines for selecting external components.

SETTING THE OUTPUT VOLTAGE (ADJUSTABLE REGULATOR)

The output voltage is set using the feedback pin and a resistor divider connected to the output as shown in *Figure 1*. The feedback pin voltage is 1.26V, so the ratio of the feedback resistors sets the output voltage according to the following equation:

$$R_{FB1} = R_{FB2} \times \frac{V_{OUT} - 1.267}{1.267} \Omega$$

INPUT CAPACITOR

A low ESR aluminum, tantalum, or ceramic capacitor is needed between the input pin and power ground. This capacitor prevents large voltage transients from appearing at the input. The capacitor is selected based on the RMS current and voltage requirements. The RMS current is given by:

$$I_{RMS} = I_{OUT} \times \frac{\sqrt{V_{OUT}(V_{IN} - V_{OUT})}}{V_{IN}}$$

The RMS current reaches its maximum ($I_{OUT}/2$) when V_{IN} equals $2V_{OUT}$. This value should be calculated for both regulators and added to give a total RMS current rating. For an aluminum or ceramic capacitor, the voltage rating should be at least 25% higher than the maximum input voltage. If a tantalum capacitor is used, the voltage rating required is about twice the maximum input voltage. The tantalum capacitor should be surge current tested by the manufacturer to prevent being shorted by the inrush current. The minimum capacitor value should be 47 μ F for lower output load current applications and less dynamic (quickly changing) load conditions. For higher output current applications or dynamic load conditions a 68 μ F to 100 μ F low ESR capacitor is recommended. It is also recommended to put a small ceramic capacitor (0.1 μ F to 4.7 μ F) between the input pins and ground to reduce high frequency spikes.

INDUCTOR SELECTION

The most critical parameters for the inductor are the inductance, peak current and the DC resistance. The inductance is related to the peak-to-peak inductor ripple current, the input and the output voltages (for 300kHz operation):

$$L = \frac{(V_{IN} - V_{OUT})V_{OUT}}{V_{IN} \times I_{RIPPLE} \times 300 \text{ kHz}}$$

A higher value of ripple current reduces inductance, but increases the conduction loss, core loss, and current stress for the inductor and switch devices. It also requires a bigger output capacitor for the same output voltage ripple requirement. A reasonable value is setting the ripple current to be 30% of the DC output current. Since the ripple current increases with the input voltage, the maximum input voltage is always used to determine the inductance. The DC resistance of the inductor is a key parameter for the efficiency. Lower DC resistance is available with a bigger winding area. A good tradeoff between the efficiency and the core size is letting the inductor copper loss equal 2% of the output power.

OUTPUT CAPACITOR

The selection of C_{OUT} is driven by the maximum allowable output voltage ripple. The output ripple in the constant frequency, PWM mode is approximated by:

$$V_{RIPPLE} = I_{RIPPLE} \left(ESR + \frac{1}{8F_S C_{OUT}} \right)$$

The ESR term usually plays the dominant role in determining the voltage ripple. Low ESR ceramic, aluminum electrolytic, or tantalum capacitors (such as Taiyo Yuden MLCC, Nichicon PL series, Sanyo OS-CON, Sprague 593D, 594D, AVX TPS, and CDE polymer aluminum) is recommended. An electrolytic capacitor is not recommended for temperatures below -25°C since its ESR rises dramatically at cold temperature. Ceramic or tantalum capacitors have much better ESR specifications at cold temperature and is preferred for low temperature applications.

BOOTSTRAP CAPACITOR

A 4.7nF ceramic capacitor or larger is recommended for the bootstrap capacitor. For applications where the input voltage is less than twice the output voltage a larger capacitor is recommended, generally 0.1 μ F to 1 μ F to ensure plenty of gate drive for the internal switches and a consistently low $R_{DS(ON)}$.

SOFT-START CAPACITOR (BOTH REGULATORS)

The LM2717 does not contain internal soft-start which allows for fast startup time but also causes high inrush current. Therefore for applications that need reduced inrush current the LM2717 has circuitry that is used to limit the inrush current on start-up of the DC/DC switching regulators. This inrush current limiting circuitry serves as a soft-start. The external SS pins are used to tailor the soft-start for a specific application. A current (I_{SS}) charges the external soft-start capacitor, C_{SS} . The soft-start time can be estimated as:

$$T_{SS} = C_{SS} * 0.6V / I_{SS}$$

When programming the softstart time simply use the equation given in the *Soft-Start Capacitor* section above.

SHUTDOWN OPERATION (BOTH REGULATORS)

The shutdown pins of the LM2717 are designed so that they may be controlled using 1.8V or higher logic signals. If the shutdown function is not to be used the pin may be left open. The maximum voltage to the shutdown pin should not exceed 7.5V. If the use of a higher voltage is desired due to system or other constraints it may be used, however a 100k or larger resistor is recommended between the applied voltage and the shutdown pin to protect the device.

SCHOTTKY DIODE

The breakdown voltage rating of D_1 and D_2 is preferred to be 25% higher than the maximum input voltage. The current rating for the diode should be equal to the maximum output current for best reliability in most applications. In cases where the input voltage is much greater than the output voltage the average diode current is lower. In this case it is possible to use a diode with a lower average current rating, approximately $(1-D) * I_{OUT}$ however the peak current rating should be higher than the maximum load current.

LAYOUT CONSIDERATIONS

The LM2717 uses two separate ground connections, PGND for the drivers and boost NMOS power device and AGND for the sensitive analog control circuitry. The AGND and PGND pins should be tied directly together at the package. The feedback and compensation networks should be connected directly to a dedicated analog ground plane and this ground plane must connect to the AGND pin. If no analog ground plane is available then the ground connections of the feedback and compensation networks must tie directly to the AGND pin. Connecting these networks to the PGND can inject noise into the system and effect performance.

The input bypass capacitor C_{IN} , as shown in *Figure 1*, must be placed close to the IC. This will reduce copper trace resistance which effects input voltage ripple of the IC. For additional input voltage filtering, a 0.1 μ F to 4.7 μ F bypass capacitors can be placed in parallel with C_{IN} , close to the V_{IN} pins to shunt any high frequency noise to ground. The output capacitors, C_{OUT1} and C_{OUT2} , should also be placed close to the IC. Any copper trace connections for the C_{OUTX} capacitors can increase the series resistance, which directly effects output voltage ripple. The feedback network, resistors R_{FB1} and R_{FB2} , should be kept close to the FB pin, and away from the inductor to minimize copper trace connections that can inject noise into the system. Trace connections made to the inductors and schottky diodes should be minimized to reduce power dissipation and increase overall efficiency. For more detail on switching power supply layout considerations see Application Note AN-1149: *Layout Guidelines for Switching Power Supplies*.
