

High Speed/High Temperature Dual Digital Isolators

Functional Diagrams

IL711

IL712

Features

- +5 V/+3.3 V CMOS / TTL Compatible
- High Speed: 150 Mbps Typical (IL711S/IL712S)
- High Temperature: -40°C to +125°C (IL711T/IL712T)
- 2500 V_{RMS} Isolation (1 min.)
- 300 ps Typical Pulse Width Distortion (IL711S/IL712S)
- 4 ns Typical Propagation Delay Skew
- 10 ns Typical Propagation Delay
- 30 kV/μs Typical Common Mode Transient Immunity
- 2 ns Channel-to-Channel Skew
- 8-pin MSOP, SOIC, and PDIP Packages
- UL1577 and IEC 61010-2001 Approval

Applications

- ADCs and DACs
- Digital Fieldbus
- RS-485 and RS-422
- Multiplexed Data Transmission
- Data Interfaces
- Board-to-Board Communication
- Digital Noise Reduction
- Operator Interface
- Ground Loop Elimination
- Peripheral Interfaces
- Serial Communication
- Logic Level Shifting

Description

NVE's IL700 family of high-speed digital isolators are CMOS devices manufactured with NVE's patented* IsoLoop[®] spintronic Giant Magnetoresistive (GMR) technology. The IL711S and IL712S are the world's fastest two-channel isolators, with a 150 Mbps typical data rate for both channels.

The symmetric magnetic coupling barrier provides a typical propagation delay of only 10 ns and a pulse width distortion as low as 300 ps (0.3 ns), achieving the best specifications of any isolator. Typical transient immunity of 30 kV/μs is unsurpassed. The IL711 has two transmit channels; the IL712 has one transmit and one receive channel. The IL712 operates full duplex, making it ideal for many fieldbus applications, including PROFIBUS.

The IL711 and IL712 are available in 8-pin MSOP, SOIC, and PDIP packages. Standard and S-Grade parts are specified over a temperature range of -40°C to +100°C; T-Grade parts are specified over a temperature range of -40°C to +125°C.

Absolute Maximum Ratings

Parameters	Symbol	Min.	Typ.	Max.	Units	Test Conditions
Storage Temperature	T_s	-55		150	°C	
Ambient Operating Temperature ⁽¹⁾ IL711T/IL712T	T_A	-55		125 135	°C

Common Mode Transient Immunity (Output Logic High or Logic Low) ⁽⁴⁾	$ CM_H , CM_L $	20	30		kV/ μ s	$V_{cm} = 300 \text{ V}$
Channel to Channel Skew	t_{CSK}		2	3	ns	$C_L = 15 \text{ pF}$
Dynamic Power Consumption ⁽⁶⁾			200	340	μ A/MHz	per channel
Magnetic Field Immunity⁽⁸⁾ ($V_{DD2} = 5V, 3V < V_{DD1} < 5.5V$)						
Power Frequency Magnetic Immunity	H_{PF}	2800	3500		A/m	50Hz/60Hz
Pulse Magnetic Field Immunity	H_{PM}	4000	4500		A/m	$t_p = 8 \mu s$
Damped Oscillatory Magnetic Field	H_{OSC}	4000	4500		A/m	0.1Hz – 1MHz
Cross-axis Immunity Multiplier ⁽⁹⁾	K_X		2.5			

Notes (apply to both 3.3 V and 5 V specifications):

1. Absolute maximum ambient operating temperature means the device will not be damaged if operated under these conditions. It does not guarantee performance.
2. PWD is defined as $|t_{PHL} - t_{PLH}|$. %PWD is equal to PWD divided by pulse width.
3. t_{PSK} is the magnitude of the worst-case difference in t_{PHL} and/or t_{PLH} between devices at 25°C.
4. CM_H is the maximum common mode voltage slew rate that can be sustained while maintaining $V_o > 0.8 V_{DD2}$. CM_L is the maximum common mode input voltage that can be sustained while maintaining $V_o < 0.8 V$. The common mode voltage slew rates apply to both rising and falling common mode voltage edges.
5. Device is considered a two terminal device: pins 1–4 shorted and pins 5–8 shorted.
6. Dynamic power consumption is calculated per channel and is supplied by the channel's input side power supply.
7. Minimum pulse width is the minimum value at which specified PWD is guaranteed.
8. The relevant test and measurement methods are given in the Electromagnetic Compatibility section on p. 6.
9. External magnetic field immunity is improved by this factor if the field direction is "end-to-end" rather than to "pin-to-pin" (see diagram on p. 6).

Application Information

Electrostatic Discharge Sensitivity

This product has been tested for electrostatic sensitivity to the limits stated in the specifications. However, NVE recommends that all integrated circuits be handled with appropriate care to avoid damage. Damage caused by inappropriate handling or storage could range from performance degradation to complete failure.

Electromagnetic Compatibility

IL700-Series Isolators are fully compliant with generic EMC standards EN50081, EN50082-1 and the umbrella line-voltage standard for Information Technology Equipment (ITE) EN61000. The IsoLoop Isolator's Wheatstone bridge configuration and differential magnetic field signaling ensure excellent EMC performance against all relevant standards. NVE conducted compliance tests in the categories below:

EN50081-1

Residential, Commercial & Light Industrial
Methods EN55022, EN55014

EN50082-2: Industrial Environment

Methods EN61000-4-2 (ESD), EN61000-4-3 (Electromagnetic Field Immunity), EN61000-4-4 (Electrical Transient Immunity), EN61000-4-6 (RFI Immunity), EN61000-4-8 (Power Frequency Magnetic Field Immunity), EN61000-4-9 (Pulsed Magnetic Field), EN61000-4-10 (Damped Oscillatory Magnetic Field)

ENV50204

Radiated Field from Digital Telephones (Immunity Test)

Immunity to external magnetic fields is even higher if the field direction is "end-to-end" rather than to "pin-to-pin" as shown in the diagram below:

Cross-axis Field Direction

Dynamic Power Consumption

IsoLoop Isolators achieve their low power consumption from the way they transmit data across the isolation barrier. By detecting the edge transitions of the input logic signal and converting these to narrow current pulses, a magnetic field is created around the GMR Wheatstone bridge. Depending on the direction of the magnetic field, the bridge causes the output comparator to switch following the input logic signal. Since the current pulses are narrow, about 2.5 ns, the power consumption is independent of mark-to-space ratio and solely dependent on frequency. This has obvious advantages over optocouplers, which have power consumption heavily dependent on mark-to-space ratio.

Power Supply Decoupling

Both power supplies to these devices should be decoupled with low-ESR 47 nF ceramic capacitors. Ground planes for both GND₁ and GND₂ are highly recommended for data rates above 10 Mbps. Capacitors must be located as close as possible to the V_{DD} pins.

Signal Status on Start-up and Shut Down

To minimize power dissipation, input signals are differentiated and then latched on the output side of the isolation barrier to reconstruct the signal. This could result in an ambiguous output state depending on power up, shutdown and power loss sequencing. Therefore, the designer should consider including an initialization signal in the start-up circuit. Initialization consists of toggling the input either high then low, or low then high.

Data Transmission Rates

The reliability of a transmission system is directly related to the accuracy and quality of the transmitted digital information. For a digital system, those parameters which determine the limits of the data transmission are pulse width distortion and propagation delay skew.

Propagation delay is the time taken for the signal to travel through the device. This is usually different when sending a low-to-high than when sending a high-to-low signal. This difference, or error, is called pulse width distortion (PWD) and is usually in nanoseconds. It may also be expressed as a percentage:

$$\text{PWD}\% = \frac{\text{Maximum Pulse Width Distortion (ns)}}{\text{Signal Pulse Width (ns)}} \times 100\%$$

For example, with data rates of 12.5 Mbps:

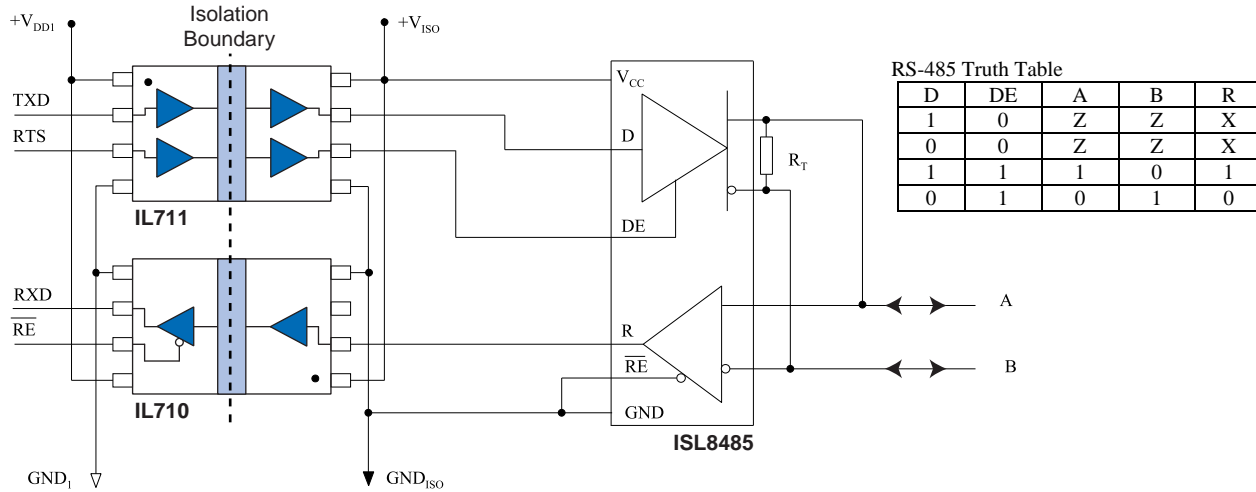

$$\text{PWD}\% = \frac{3 \text{ ns}}{80 \text{ ns}} \times 100\% = 3.75\%$$

This figure is almost **three times** better than any available optocoupler with the same temperature range, and **two times** better than any optocoupler regardless of published temperature range. IsoLoop isolators exceed the 10% maximum PWD recommended by PROFIBUS, and will run to nearly 35 Mb within the 10% limit.

Propagation delay skew is the signal propagation difference between two or more channels. This becomes significant in clocked systems because it is undesirable for the clock pulse to arrive before the data has settled. Short propagation delay skew is therefore especially critical in high data rate parallel systems for establishing and maintaining accuracy and repeatability. Worst-case channel-to-channel skew in an IL700 Isolator is only 3 ns, which is **ten times** better than any optocoupler. IL700 Isolators have a maximum propagation delay skew of 6 ns, which is **five times** better than any optocoupler.

Application Diagrams

Isolated PROFIBUS / RS-485

NVE offers a unique line of PROFIBUS / RS-485 transceivers, but IL700 high-speed digital signal isolators can also be used as part of multi-chip designs with non-isolated PROFIBUS transceivers.

ISB-DS-001-IL711/12-R
October 2008

Changes

- IEC 61010 approval for MSOP versions.

ISB-DS-001-IL711/12-Q

Changes

- Added magnetic field immunity and electromagnetic compatibility specifications.

ISB-DS-001-IL711/12-P

Changes

- Correct SOIC package drawing.

ISB-DS-001-IL711/12-O

Changes

- Note on all package drawings that pin-spacing tolerances are non-accumulating; change MSOP pin-spacing dimensions and tolerance accordingly.

ISB-DS-001-IL711/12-N

Changes

- Changed lower limit of length on PDIP package drawing.
- Tightened pin-spacing tolerance on MSOP package drawing.

ISB-DS-001-IL711/12-M

Changes

- Changed ordering information to reflect that devices are now fully RoHS compliant with no exemptions.

ISB-DS-001-IL711/12-L

Changes

- Eliminated soldering profile chart

ISB-DS-001-IL711/12-K

Changes

- Added RS-485 application circuit

ISB-DS-001-IL711/12-J

Changes

- MSOP packages, S- and T-Grades added
- Order information updated

ISB-DS-001-IL711/12-I

Changes

Added MSOP Specifications

Updated IEC and UL Approval Numbers

About NVE

An ISO 9001 Certified Company

NVE Corporation manufactures innovative products based on unique spintronic Giant Magnetoresistive (GMR) technology. Products include Magnetic Field Sensors, Magnetic Field Gradient Sensors (Gradiometers), Digital Magnetic Field Sensors, Digital Signal Isolators, and Isolated Bus Transceivers.

NVE pioneered spintronics and in 1994 introduced the world's first products using GMR material, a line of ultra-precise magnetic sensors for position, magnetic media, gear speed and current sensing.
