

# DDR SDRAM SMALL- OUTLINE DIMM

## MT18VDDF12872H – 1GB

For the latest data sheet, please refer to the Micron® Web site: [www.micron.com/products/modules](http://www.micron.com/products/modules)

### Features

- 200-pin, small-outline, dual in-line memory module (SODIMM)
- Fast data transfer rates: PC3200
- Utilizes 400 MT/s DDR SDRAM components
- Supports ECC error detection and correction
- 1GB (128 Meg x 72)
- VDD = VDDQ = +2.6V
- VDDSPD = +2.3V to +3.6V
- 2.5V I/O (SSTL\_2 compatible)
- Commands entered on each positive CK edge
- DQS edge-aligned with data for READS; center-aligned with data for WRITES
- Internal, pipelined double data rate (DDR) architecture; two data accesses per clock cycle
- Bidirectional data strobe (DQS) transmitted/received with data—i.e., source-synchronous data capture
- Differential clock inputs CK and CK#
- Four internal device banks for concurrent operation
- Programmable burst lengths: 2, 4, or 8
- Auto precharge option
- Auto Refresh and Self Refresh Modes
- 7.8125µs maximum average periodic refresh interval
- Serial Presence Detect (SPD) with EEPROM
- Programmable READ CAS latency
- Gold edge contacts

**Figure 1: 200-Pin SODIMM (MO-224)**

### OPTIONS

- Package
  - 200-pin SODIMM (standard) G
  - 200-pin SODIMM (lead-free)<sup>1</sup> Y
- Frequency/CAS Latency<sup>2</sup>
  - 200 MHz (400 MT/s) CL = 3 -40B
- PCB Height
  - 1.25in. (31.75mm)

### MARKING

NOTE: 1. Contact Micron regarding product availability.  
2. CL = CAS (READ) latency.

**Table 1: Address Table**

	1GB
Refresh Count	8K
Device Row Addressing	8K (A0–A12)
Device Bank Addressing	4 (BA0, BA1)
Device Configuration	512Mb (64 Meg x 8)
Device Column Addressing	2K (A0–A9, A11)
Module Rank Addressing	2 (S0#, S1#)

**Table 2: Part Numbers and Timing Parameters**

PART NUMBER	MODULE DENSITY	CONFIGURATION	MODULE BANDWIDTH	MEMORY CLOCK/ DATA RATE	LATENCY (CL - $t_{RCD}$ - $t_{RP}$ )
MT18VDDF12872HG-40B__	1GB	128 Meg x 72	3.2 GB/s	5ns/400 MT/s	3-3-3
MT18VDDF12872HY-40B__	1GB	128 Meg x 72	3.2 GB/s	5ns/400 MT/s	3-3-3

NOTE:

All part numbers end with a two-place code (not shown), designating component and PCB revisions. Consult factory for current revision codes. Example: MT18VDDF12872HG-40BA1.

**Figure 2: Module Layout**

**Table 5: Pin Descriptions**

Pin numbers may not correlate with symbols; refer to Pin Assignment Tables on page 3 for more information

PIN NUMBERS	SYMBOL	TYPE	DESCRIPTION
118, 119, 120	WE#, CAS#,RAS#	Input	Command Inputs: RAS#, CAS#, and WE# (along with S#) define the command being entered.
35, 37, 89, 91, 158, 160	CK0, CK0#, CK1, CK1#, CK2, CK2#	Input	Clock: CK, CK# are differential clock inputs. All address and control input signals are sampled on the crossing of the positive edge of CK, and negative edge of CK#. Output data (DQs and DQS) is referenced to the crossings of CK and CK#.
95, 96	CKE0, CKE1	Input	Clock Enable: CKE HIGH activates and CKE LOW deactivates the internal clock, input buffers and output drivers. Taking CKE LOW provides PRECHARGE POWER-DOWN and SELF REFRESH operations (all device banks idle), or ACTIVE POWER-DOWN (row ACTIVE in any device bank). CKE is synchronous for POWER-DOWN entry and exit, and for SELF REFRESH entry. CKE is asynchronous for SELF REFRESH exit and for disabling the outputs. CKE must be maintained HIGH throughout read and write accesses. Input buffers (excluding CK, CK# and CKE) are disabled during POWER-DOWN. Input buffers (excluding CKE) are disabled during SELF REFRESH. CKE is an SSTL_2 input but will detect an LVCMOS LOW level after VDD is applied and until CKE is first brought HIGH. After CKE is brought HIGH, it becomes an SSTL_2 input only.
121, 122	S0#, S1#	Input	Chip Selects: S# enables (registered LOW) and disables (registered HIGH) the command decoder. All commands are masked when S# is registered HIGH. S# is considered part of the command code.
116, 117	BA0, BA1	Input	Bank Address: BA0 and BA1 define to which device bank an ACTIVE, READ, WRITE, or PRECHARGE command is being applied.
99, 100, 101, 102, 105,106, 107, 108, 109, 110, 111, 112, 115	A0-A12	Input	Address Inputs: Provide the row address for ACTIVE commands, and the column address and auto precharge bit (A10) for READ/WRITE commands, to select one location out of the memory array in the respective device bank. A10 sampled during a PRECHARGE command determines whether the PRECHARGE applies to one device bank (A10 LOW, device bank selected by BA0, BA1) or all device banks (A10 HIGH). The address inputs also provide the op-code during a MODE REGISTER SET command. BA0 and BA1 define which mode register (mode register or extended mode register) is loaded during the LOAD MODE REGISTER command.
12, 26, 48, 62, 78, 134, 148, 170, 184	DM0-DM8	Input	Data Write Mask. DM LOW allows WRITE operation. DM HIGH blocks WRITE operation. DM lines do not affect READ operation.
11, 25, 47, 61, 77, 133, 147, 169, 183	DQS0-DQS8	Input/ Output	Data Strobe: Output with READ data, input with WRITE data. DQS is edge-aligned with READ data, centered in WRITE data. Used to capture data.
71, 72, 73, 74, 79, 80, 83, 84	CB0-CB7	Input/ Output	Check Bits.

**Table 5: Pin Descriptions (Continued)**

Pin numbers may not correlate with symbols; refer to Pin Assignment Tables on page 3 for more information

PIN NUMBERS	SYMBOL	TYPE	DESCRIPTION
5, 6, 7, 8, 13, 14, 17, 18, 19, 20, 23, 24, 29, 30, 31, 32, 41, 42, 43, 44, 49, 50, 53, 54, 55, 56, 59, 60, 65, 66, 67, 68, 127, 128, 129, 130, 135, 136, 139, 140, 141, 142, 145, 146, 151, 152, 153, 154, 163, 164, 165, 166, 171, 172, 175, 176, 177, 178, 181, 182, 187, 188, 189, 190	DQ0–DQ63	Input/Output	Data I/Os: Data bus.
195	SCL	Input	Serial Clock for Presence-Detect: SCL is used to synchronize the presence-detect data transfer to and from the module.
194, 196, 198	SA0–SA2	Input	Presence-Detect Address Inputs: These pins are used to configure the presence-detect device.
193	SDA	Input/Output	Serial Presence-Detect Data: SDA is a bidirectional pin used to transfer addresses and data into and out of the presence-detect portion of the module.
1, 2	VREF	Supply	SSTL_2 reference voltage.
9, 10, 21, 22, 33, 34, 36, 45, 46, 57, 58, 69, 70, 81, 82, 92, 93, 94, 113, 114, 131, 132, 143, 144, 155, 156, 157, 167, 168, 179, 180, 191, 192	VDD	Supply	Power Supply: +2.6V ±0.1V.
3, 4, 15, 16, 27, 28, 38, 39, 40, 51, 52, 63, 64, 75, 76, 87, 88, 90, 103, 104, 125, 126, 137, 138, 149, 150, 159, 161, 162, 173, 174, 185, 186, 200	Vss	Supply	Ground.
197	VDDSPD	Supply	Serial EEPROM positive power supply: +2.3V to +3.6V.
85, 97, 98, 123, 124, 199	NC	—	No Connect: These pins should be left unconnected.
71, 72, 73, 74, 79, 80, 83, 84, 86	DNU	—	Do Not Use: These pins are not connected on this module, but are assigned pins on other modules in this product family.

Figure 3: Functional Block Diagram

NOTE:

- All resistor values are 22Ω unless otherwise specified.
- Per industry standard, Micron utilizes various component speed grades as referenced in the Module Part Numbering Guide at [www.micron.com/numberguide](http://www.micron.com/numberguide).

Standard modules use the following DDR SDRAM devices:  
MT46V64M8FN (1GB)

Low-power modules use the following DDR SDRAM devices:  
MT46V64M8BN (1GB)

## General Description

The MT18VDDF12872H is a high-speed CMOS, dynamic random-access, 1GB memory module organized in a x72 configuration. DDR SDRAM modules use internally configured quad-bank DDR SDRAM devices.

DDR SDRAM modules use a double data rate architecture to achieve high-speed operation. The double data rate architecture is essentially a  $2n$ -prefetch architecture with an interface designed to transfer two data words per clock cycle at the I/O pins. A single read or write access for the DDR SDRAM module effectively consists of a single  $2n$ -bit wide, one-clock-cycle data transfer at the internal DRAM core and two corresponding  $n$ -bit wide, one-half-clock-cycle data transfers at the I/O pins.

A bidirectional data strobe (DQS) is transmitted externally, along with data, for use in data capture at the receiver. DQS is an intermittent strobe transmitted by the DDR SDRAM during READs and by the memory controller during WRITEs. DQS is edge-aligned with data for READs and center-aligned with data for WRITEs.

DDR SDRAM modules operate from a differential clock (CK and CK#); the crossing of CK going HIGH and CK# going LOW will be referred to as the positive edge of CK. Commands (address and control signals) are registered at every positive edge of CK. Input data is registered on both edges of DQS, and output data is referenced to both edges of DQS, as well as to both edges of CK.

Read and write accesses to DDR SDRAM modules are burst oriented; accesses start at a selected location and continue for a programmed number of locations in a programmed sequence. Accesses begin with the registration of an ACTIVE command, which is then followed by a READ or WRITE command. The address bits registered coincident with the ACTIVE command are used to select the device bank and row to be accessed (BA0, BA1 select devices bank; A0–A12 select device row). The address bits registered coincident with the READ or WRITE command are used to select the device bank and the starting device column location for the burst access.

DDR SDRAM modules provide for programmable read or write burst lengths of 2, 4, or 8 locations. An auto precharge function may be enabled to provide a self-timed row precharge that is initiated at the end of the burst access.

As with standard SDR SDRAM modules, the pipelined, multibank architecture of DDR SDRAM modules allows for concurrent operation, thereby providing

high effective bandwidth by hiding row precharge and activation time.

An auto refresh mode is provided, along with a power-saving power-down mode. All inputs are compatible with the JEDEC Standard for SSTL\_2. All outputs are SSTL\_2, Class II compatible. For more information regarding DDR SDRAM operation, refer to the 512Mb DDR SDRAM component data sheet.

## Serial Presence-Detect Operation

DDR SDRAM modules incorporate serial presence-detect (SPD). The SPD function is implemented using a 2,048-bit EEPROM. This nonvolatile storage device contains 256 bytes. The first 128 bytes can be programmed by Micron to identify the module type and various SDRAM organizations and timing parameters. The remaining 128 bytes of storage are available for use by the customer. System READ/WRITE operations between the master (system logic) and the slave EEPROM device occur via a standard I<sup>2</sup>C bus using the DIMM's SCL (clock) and SDA (data) signals, together with SA (2:0), which provide eight unique DIMM/EEPROM addresses. Write protect (WP) is tied to ground on the module, permanently disabling hardware write protect.

## Mode Register Definition

The mode register is used to define the specific mode of operation of DDR SDRAM devices. This definition includes the selection of a burst length, a burst type, a CAS latency and an operating mode, as shown in Figure 4, Mode Register Definition Diagram, on page 8. The mode register is programmed via the MODE REGISTER SET command (with BA0 = 0 and BA1 = 0) and will retain the stored information until it is programmed again or the device loses power (except for bit A8, which is self-clearing).

Reprogramming the mode register will not alter the contents of the memory, provided it is performed correctly. The mode register must be loaded (reloaded) when all device banks are idle and no bursts are in progress, and the controller must wait the specified time before initiating the subsequent operation. Violating either of these requirements will result in unspecified operation.

Mode register bits A0–A2 specify the burst length, A3 specifies the type of burst (sequential or interleaved), A4–A6 specify the CAS latency, and A7–A12 specify the operating mode.

### Burst Length

Read and write accesses to DDR SDRAM devices are burst oriented, with the burst length being programmable, as shown in Figure 4, Mode Register Definition Diagram. The burst length determines the maximum number of column locations that can be accessed for a given READ or WRITE command. Burst lengths of 2, 4, or 8 locations are available for both the sequential and the interleaved burst types.

Reserved states should not be used, as unknown operation or incompatibility with future versions may result.

When a READ or WRITE command is issued, a block of columns equal to the burst length is effectively selected. All accesses for that burst take place within this block, meaning that the burst will wrap within the block if a boundary is reached. The block is uniquely selected by A1–Ai when the burst length is set to two, by A2–Ai when the burst length is set to four and by A3–Ai when the burst length is set to eight (where Ai is the most significant column address bit for a given configuration. See Note 5 of Table 6, Burst Definition Table, on page 9, for Ai values). The remaining (least significant) address bit(s) is (are) used to select the starting location within the block. The programmed burst length applies to both read and write bursts.

### Burst Type

Accesses within a given burst may be programmed to be either sequential or interleaved; this is referred to as the burst type and is selected via bit M3.

The ordering of accesses within a burst is determined by the burst length, the burst type and the starting column address, as shown in Table 6, Burst Definition Table, on page 9.

### Read Latency

The READ latency is the delay, in clock cycles, between the registration of a READ command and the availability of the first bit of output data. The latency can be set to 2, 2.5, or 3clocks, as shown in Figure 5, CAS Latency Diagram, on page 9.

If a READ command is registered at clock edge  $n$ , and the latency is  $m$  clocks, the data will be available nominally coincident with clock edge  $n + m$ . The CAS Latency Table indicates the operating frequencies at which each CAS latency setting can be used.

Reserved states should not be used as unknown operation or incompatibility with future versions may result.

Figure 4: Mode Register Definition Diagram

**Table 6: Burst Definition Table**

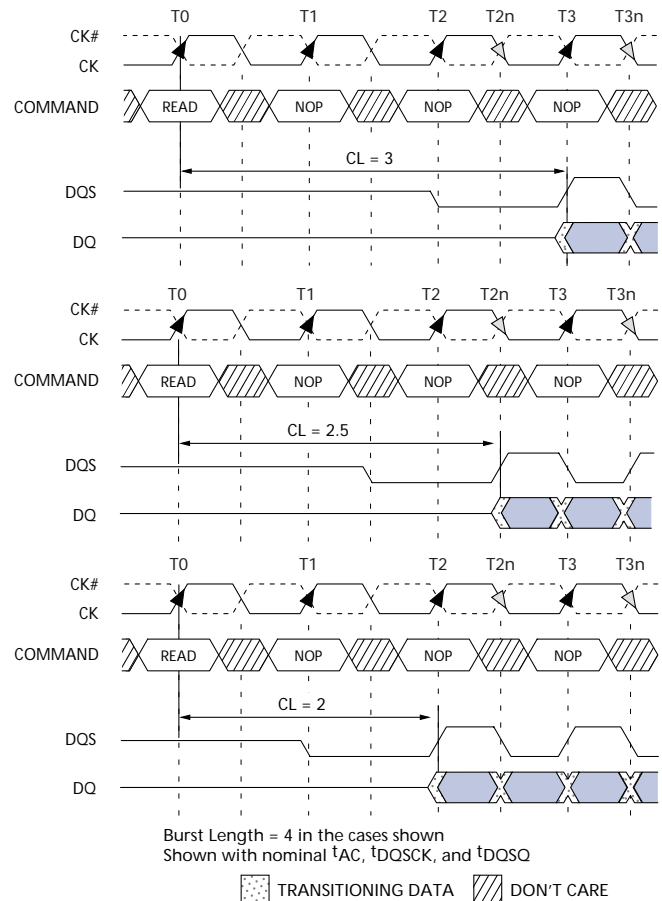

BURST LENGTH	STARTING COLUMN ADDRESS		ORDER OF ACCESSES WITHIN A BURST	
			TYPE = SEQUENTIAL	TYPE = INTERLEAVED
2	<b>A0</b>			
	0		0-1	0-1
	1		1-0	1-0
4	<b>A1 A0</b>			
	0 0		0-1-2-3	0-1-2-3
	0 1		1-2-3-0	1-0-3-2
	1 0		2-3-0-1	2-3-0-1
8	<b>A2 A1 A0</b>			
	0 0 0		0-1-2-3-4-5-6-7	0-1-2-3-4-5-6-7
	0 0 1		1-2-3-4-5-6-7-0	1-0-3-2-5-4-7-6
	0 1 0		2-3-4-5-6-7-0-1	2-3-0-1-6-7-4-5
	0 1 1		3-4-5-6-7-0-1-2	3-2-1-0-7-6-5-4
	1 0 0		4-5-6-7-0-1-2-3	4-5-6-7-0-1-2-3
	1 0 1		5-6-7-0-1-2-3-4	5-4-7-6-1-0-3-2
	1 1 0		6-7-0-1-2-3-4-5	6-7-4-5-2-3-0-1
1 1 1		7-0-1-2-3-4-5-6	7-6-5-4-3-2-1-0	

**NOTE:**

- For a burst length of two, A1–Ai select the two-data-element block; A0 selects the first access within the block.
- For a burst length of four, A2–Ai select the four-data-element block; A0–A1 select the first access within the block.
- For a burst length of eight, A3–Ai select the eight-data-element block; A0–A2 select the first access within the block.
- Whenever a boundary of the block is reached within a given sequence above, the following access wraps within the block.
- $i = 9, 11$  (1GB)

**Table 7: CAS Latency (CL) Table**

SPEED	ALLOWABLE OPERATING CLOCK FREQUENCY (MHZ)		
	CL = 2	CL = 2.5	CL = 3
-40B	$75 \leq f \leq 133$	$75 \leq f \leq 167$	$125 \leq f \leq 200$

**Figure 5: CAS Latency Diagram**

**Operating Mode**

The normal operating mode is selected by issuing a **MODE REGISTER SET** command with bits A7–A12 each set to zero, and bits A0–A6 set to the desired values. A DLL reset is initiated by issuing a **MODE REGISTER SET** command with bits A7 and A9–A12 each set to zero, bit A8 set to one, and bits A0–A6 set to the desired values. Although not required by the Micron device, JEDEC specifications recommend when a **LOAD MODE REGISTER** command is issued to reset the DLL, it should always be followed by a **LOAD MODE REGISTER** command to select normal operating mode.

All other combinations of values for A7–A12 are reserved for future use and/or test modes. Test modes and reserved states should not be used because unknown operation or incompatibility with future versions may result.

### Extended Mode Register

The extended mode register controls functions beyond those controlled by the mode register; these additional functions are DLL enable/disable and output drive strength. These functions are controlled via the bits shown in Figure 6, Extended Mode Register Definition Diagram, on page 10. The extended mode register is programmed via the LOAD MODE REGISTER command to the mode register (with BA0 = 1 and BA1 = 0) and will retain the stored information until it is programmed again or the device loses power. The enabling of the DLL should always be followed by a LOAD MODE REGISTER command to the mode register (BA0/ BA1 both LOW) to reset the DLL.

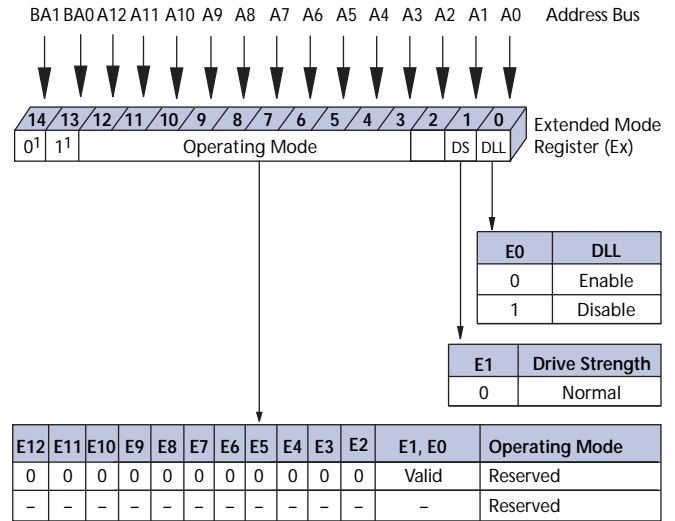

The extended mode register must be loaded when all device banks are idle and no bursts are in progress, and the controller must wait the specified time before initiating any subsequent operation. Violating either of these requirements could result in unspecified operation.

### DLL Enable/Disable

The DLL must be enabled for normal operation. DLL enable is required during power-up initialization and upon returning to normal operation after having disabled the DLL for the purpose of debug or evaluation. (When the device exits self refresh mode, the DLL

is enabled automatically.) Any time the DLL is enabled, a DLL Reset and 200 clock cycles with CKE HIGH must occur before a READ command can be issued.

**Figure 6: Extended Mode Register Definition Diagram**

NOTE:

1. BA1 and BA0 (E14 and E13) must be "0, 1" to select the Extended Mode Register (vs. the base Mode Register).
2. QFC# is not supported.

## Commands

Table 8, Commands Truth Table, and Table 9, DM Operation Truth Table, provide a general reference of available commands. For a more detailed description

of commands and operations, refer to the 512Mb DDR SDRAM component data sheet.

**Table 8: Commands Truth Table**

CKE is HIGH for all commands shown except SELF REFRESH

NAME (FUNCTION)	CS#	RAS#	CAS#	WE#	ADDR	NOTES
DESELECT (NOP)	H	X	X	X	X	1
NO OPERATION (NOP)	L	H	H	H	X	1
ACTIVE (Select bank and activate row)	L	L	H	H	Bank/Row	2
READ (Select bank and column, and start READ burst)	L	H	L	H	Bank/Col	3
WRITE (Select bank and column, and start WRITE burst)	L	H	L	L	Bank/Col	3
BURST TERMINATE	L	H	H	L	X	4
PRECHARGE (Deactivate row in bank or banks)	L	L	H	L	Code	5
AUTO REFRESH or SELF REFRESH (Enter self refresh mode)	L	L	L	H	X	6, 7
LOAD MODE REGISTER	L	L	L	L	Op-Code	8

NOTE:

1. Deselect and NOP are functionally interchangeable.
2. BA0–BA1 provide device bank address and A0–A12 provide device row address.
3. BA0–BA1 provide device bank address; A0–A9, A11 provide device column address; A10 HIGH enables the auto precharge feature (nonpersistent), and A10 LOW disables the auto precharge feature.
4. Applies only to read bursts with auto precharge disabled; this command is undefined (and should not be used) for READ bursts with auto precharge enabled and for WRITE bursts.
5. A10 LOW: BA0–BA1 determine which device bank is precharged. A10 HIGH: all device banks are precharged and BA0–BA1 are “Don’t Care.”
6. This command is AUTO REFRESH if CKE is HIGH, SELF REFRESH if CKE is LOW.
7. Internal refresh counter controls device row addressing; all inputs and I/Os are “Don’t Care” except for CKE.
8. BA0–BA1 select either the mode register or the extended mode register (BA0 = 0, BA1 = 0 select the mode register; BA0 = 1, BA1 = 0 select extended mode register; other combinations of BA0–BA1 are reserved). A0–A12 provide the op-code to be written to the selected mode register.

**Table 9: DM Operation Truth Table**

Used to mask write data; provided coincident with the corresponding data

NAME (FUNCTION)	DM	DQS
WRITE Enable	L	Valid
WRITE Inhibit	H	X

### Absolute Maximum Ratings

Stresses greater than those listed may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions above those indicated in the opera-

tional sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Voltage on VDD Supply  
Relative to VSS . . . . . -1V to +3.6V  
Voltage on VDDQ Supply

## Notes

1. All voltages referenced to VSS.
2. Tests for AC timing, IDD, and electrical AC and DC characteristics may be conducted at nominal reference/supply voltage levels, but the related specifications and device operation are guaranteed for the full voltage range specified.
3. Outputs measured with equivalent load:

4. AC timing and IDD tests may use a  $V_{IL}$ -to- $V_{IH}$  swing of up to 1.5V in the test environment, but input timing is still referenced to  $V_{REF}$  (or to the crossing point for CK/CK#), and parameter specifications are guaranteed for the specified AC input levels under normal use conditions. The minimum slew rate for the input signals used to test the device is 1V/ns in the range between  $V_{IL}(AC)$  and  $V_{IH}(AC)$ .
5. The AC and DC input level specifications are as defined in the SSTL\_2 Standard (i.e., the receiver will effectively switch as a result of the signal crossing the AC input level, and will remain in that state as long as the signal does not ring back above [below] the DC input LOW [HIGH] level).
6.  $V_{REF}$  is expected to equal  $V_{DDQ}/2$  of the transmitting device and to track variations in the DC level of the same. Peak-to-peak noise (non-common mode) on  $V_{REF}$  may not exceed  $\pm 2$  percent of the DC value. Thus, from  $V_{DDQ}/2$ ,  $V_{REF}$  is allowed  $\pm 25$ mV for DC error and an additional  $\pm 25$ mV for AC noise. This measurement is to be taken at the nearest  $V_{REF}$  bypass capacitor.
7.  $V_{TT}$  is not applied directly to the device.  $V_{TT}$  is a system supply for signal termination resistors, is expected to be set equal to  $V_{REF}$  and must track variations in the DC level of  $V_{REF}$ .
8.  $I_{DD}$  is dependent on output loading and cycle rates. Specified values are obtained with minimum cycle time at  $CL = 3$  with the outputs open.
9. Enables on-chip refresh and address counters.
10.  $I_{DD}$  specifications are tested after the device is properly initialized, and is averaged at the defined cycle rate.
11. This parameter is sampled.  $V_{DD} = +2.5V \pm 0.2V$ ,  $V_{DDQ} = +2.5V \pm 0.2V$ ,  $V_{REF} = V_{SS}$ ,  $f = 100$  MHz,  $T_A = 25^\circ C$ ,  $V_{OUT}(DC) = V_{DDQ}/2$ ,  $V_{OUT}$  (peak to peak) = 0.2V. DM input is grouped with I/O pins, reflecting the fact that they are matched in loading.
12. For slew rates  $< 1$  V/ns and  $\geq$  to 0.5 Vns. If the slew rate is  $< 0.5V/ns$ , timing must be derated:  $t_{IS}$  has an additional 50ps per each 100 mV/ns reduction in slew rate from 500mV/ns, while  $t_{IH}$  is unaffected. If the slew rate exceeds 4.5 V/ns, functionality is uncertain. For -40B, slew rates must be  $\geq 0.5$  V/ns.
13. The CK/CK# input reference level (for timing referenced to CK/CK#) is the point at which CK and CK# cross; the input reference level for signals other than CK/CK# is  $V_{REF}$ .
14. Inputs are not recognized as valid until  $V_{REF}$  stabilizes. Exception: during the period before  $V_{REF}$  stabilizes,  $CKE \leq 0.3 \times V_{DDQ}$  is recognized as LOW.
15. The output timing reference level, as measured at the timing reference point indicated in Note 3, is  $V_{TT}$ .
16.  $t_{HZ}$  and  $t_{LZ}$  transitions occur in the same access time windows as valid data transitions. These parameters are not referenced to a specific voltage level, but specify when the device output is no longer driving (HZ) or begins driving (LZ).
17. The intent of the Don't Care state after completion of the postamble is the DQS-driven signal should either be high, low, or high-Z and that any signal transition within the input switching region must follow valid input requirements. That is, if DQS transitions high (above  $V_{IH}$  DC (MIN)) then it must not transition low (below  $V_{IH}$  DC) prior to  $t_{DQSH}$  (MIN).
18. This is not a device limit. The device will operate with a negative value, but system performance could be degraded due to bus turnaround.
19. It is recommended that DQS be valid (HIGH or LOW) on or before the WRITE command. The case shown (DQS going from High-Z to logic LOW) applies when no WRITES were previously in progress on the bus. If a previous WRITE was in progress, DQS could be HIGH during this time, depending on  $t_{DQSS}$ .
20. MIN ( $t_{RC}$  or  $t_{RFC}$ ) for  $I_{DD}$  measurements is the smallest multiple of  $t_{CK}$  that meets the minimum absolute Value for the respective parameter.  $t_{RAS}$  (MAX) for  $I_{DD}$  measurements is the largest multiple of  $t_{CK}$  that meets the maximum absolute value for  $t_{RAS}$ .
21. The refresh period 64ms. This equates to an average refresh rate of 7.8125 $\mu s$ . However, an AUTO REFRESH command must be asserted at least once every 70.3 $\mu s$ ; burst refreshing or posting by

the DRAM controller greater than eight refresh cycles is not allowed.

22. The valid data window is derived by achieving other specifications:  $t_{HP}$  ( $t_{CK}/2$ ),  $t_{DQSQ}$ , and  $t_{QH}$  ( $t_{QH} = t_{HP} - t_{QHS}$ ). The data valid window derates directly proportional with the clock duty cycle and a practical data valid window can be derived. The clock is allowed a maximum duty cycle variation of 45/55, beyond which functionality is uncertain.
23. Each byte lane has a corresponding DQS.
24. This limit is actually a nominal value and does not result in a fail value. CKE is HIGH during REFRESH command period ( $t_{RFC}$  [MIN]) else CKE is LOW (i.e., during standby).
25. To maintain a valid level, the transitioning edge of the input must:
  - a. Sustain a constant slew rate from the current AC level through to the target AC level,  $V_{IL}(AC)$  or  $V_{IH}(AC)$ .
  - b. Reach at least the target AC level.
  - c. After the AC target level is reached, continue to maintain at least the target DC level,  $V_{IL}(DC)$  or  $V_{IH}(DC)$ .
26. JEDEC specifies CK and CK# input slew rate must be  $\geq 1V/ns$  ( $2V/ns$  differentially).
27. DQ and DM input slew rates must not deviate from DQS by more than 10 percent. If the DQ/DM/DQS slew rate is less than  $0.5V/ns$ , timing must be derated: 50ps must be added to  $t_{DS}$  and  $t_{DH}$  for each  $100mv/ns$  reduction in slew rate. If slew rate exceeds  $4V/ns$ , functionality is uncertain. For -40B, slew rates must be  $\geq 0.5 V/ns$ .
28. VDD must not vary more than 4 percent if CKE is not active while any bank is active.
29. The clock is allowed up to  $\pm 150ps$  of jitter. Each timing parameter is allowed to vary by the same

amount.  $t_{HP}$  min is the lesser of  $t_{CL}$  minimum and  $t_{CH}$  minimum actually applied to the device CK and CK# inputs, collectively during bank active.

30. READs and WRITEs with auto precharge are not allowed to be issued until  $t_{RAS}(MIN)$  can be satisfied prior to the internal precharge command being issued.
31. Any positive glitch must be less than 1/3 of the clock and not more than +300mV or 2.9V, whichever is less. Any negative glitch must be less than 1/3 of the clock cycle and not exceed either -200mV or 2.4V, whichever is more positive. The average cannot be below the +2.6V minimum.
32. Normal Output Drive Curves:
  - a. The full variation in driver pull-down current from minimum to maximum process, temperature and voltage will lie within the outer bounding lines of the V-I curve of Figure 7, Pull-Down Characteristics.
  - b. The variation in driver pull-down current within nominal limits of voltage and temperature is expected, but not guaranteed, to lie within the inner bounding lines of the V-I curve of Figure 7, Pull-Down Characteristics.
  - c. The full variation in driver pull-up current from minimum to maximum process, temperature and voltage will lie within the outer bounding lines of the V-I curve of Figure 8, Pull-Up Characteristics.
  - d. The variation in driver pull-up current within nominal limits of voltage and temperature is expected, but not guaranteed, to lie within the inner bounding lines of the V-I curve of Figure 8, Pull-Up Characteristics.

**Figure 7: Pull-Down Characteristics**

**Figure 8: Pull-Up Characteristics**

- e. The full variation in the ratio of the maximum to minimum pull-up and pull-down current should be between 0.71 and 1.4, for device drain-to-source voltages from 0.1V to 1.0V, and at the same voltage and temperature.
  - f. The full variation in the ratio of the nominal pull-up to pull-down current should be unity  $\pm 10$  percent, for device drain-to-source voltages from 0.1V to 1.0V.
33. The voltage levels used are derived from a minimum VDD level and the referenced test load. In practice, the voltage levels obtained from a properly terminated bus will provide significantly different voltage values.
  34.  $V_{IH}$  overshoot:  $V_{IH} (MAX) = V_{DDQ} + 1.5V$  for a pulse width  $\leq 3ns$  and the pulse width can not be greater than 1/3 of the cycle rate.  $V_{IL}$  undershoot:  $V_{IL} (MIN) = -1.5V$  for a pulse width  $\leq 3ns$  and the pulse width can not be greater than 1/3 of the cycle rate.
  35. VDD and VDDQ must track each other.
  36.  $t_{HZ} (MAX)$  will prevail over  $t_{DQSCK} (MAX) + t_{RPST} (MAX)$  condition.  $t_{LZ} (MIN)$  will prevail over  $t_{DQSCK} (MIN) + t_{RPRE} (MAX)$  condition.
  37.  $t_{RPST}$  end point and  $t_{RPRE}$  begin point are not referenced to a specific voltage level but specify when the device output is no longer driving ( $t_{RPST}$ ), or begins driving ( $t_{RPRE}$ ).
  38. During Initialization, VDDQ, VTT, and VREF must be equal to or less than VDD + 0.3V. Alternatively, VTT may be 1.35V maximum during power up, even if VDD/VDDQ are 0.0V, provided a minimum of  $42\Omega$  of series resistance is used between the VTT supply and the input pin.
  39. The current Micron part operates below the slowest JEDEC operating frequency of 83 MHz. As such, future die may not reflect this option.
  40. Random addressing changing and 50 percent of data changing at every transfer.
  41. Random addressing changing and 100 percent of data changing at every transfer.
  42. CKE must be active (high) during the entire time a refresh command is executed. That is, from the time the AUTO REFRESH command is registered, CKE must be active at each rising clock edge, until  $t_{REF}$  later.
  43. IDD2N specifies the DQ, DQS, and DM to be driven to a valid high or low logic level. IDD2Q is similar to IDD2F except IDD2Q specifies the address and control inputs to remain stable. Although IDD2F, IDD2N, and IDD2Q are similar, IDD2F is "worst case."
  44. Whenever the operating frequency is altered, not including jitter, the DLL is required to be reset. This is followed by 200 clock cycles.
  45. Leakage number reflects the worst case leakage possible through the module pin, not what each memory device contributes.
  46. When an input signal is HIGH or LOW, it is defined as a steady state logic HIGH or LOW.
  47. This is the DC voltage supplied at the DRAM and is inclusive of all noise up to 20MHz. Any noise above 20MHz at the DRAM generated from any source other than that of the DRAM itself may not exceed the DC voltage range of  $+2.6V \pm 0.1V$ .

## Initialization

To ensure device operation the DRAM must be initialized as described below:

1. Simultaneously apply power to VDD and VDDQ.
2. Apply VREF and then VTT power.
3. Assert and hold CKE at a LVCMOS logic low.
4. Provide stable CLOCK signals.
5. Wait at least 200 $\mu$ s.
6. Bring CKE high and provide at least one NOP or DESELECT command. At this point the CKE input changes from a LVCMOS input to a SSTL2 input only and will remain a SSTL\_2 input unless a power cycle occurs.
7. Perform a PRECHARGE ALL command.
8. Wait at least  $t_{RP}$  time, during this time NOPs or DESELECT commands must be given.
9. Using the LMR command program the Extended Mode Register (E0 = 0 to enable the DLL and E1 = 0 for normal drive or E1 = 1 for reduced drive, E2 through En must be set to 0; where n = most significant bit).
10. Wait at least  $t_{MRD}$  time, only NOPs or DESELECT commands are allowed.
11. Using the LMR command program the Mode Register to set operating parameters and to reset the DLL. Note at least 200 clock cycles are required between a DLL reset and any READ command.
12. Wait at least  $t_{MRD}$  time, only NOPs or DESELECT commands are allowed.
13. Issue a PRECHARGE ALL command.
14. Wait at least  $t_{RP}$  time, only NOPs or DESELECT commands are allowed.
15. Issue an AUTO REFRESH command (Note this may be moved prior to step 13).
16. Wait at least  $t_{RFC}$  time, only NOPs or DESELECT commands are allowed.
17. Issue an AUTO REFRESH command (Note this may be moved prior to step 13).
18. Wait at least  $t_{RFC}$  time, only NOPs or DESELECT commands are allowed.
19. Although not required by the Micron device, JEDEC requires a LMR command to clear the DLL bit (set M8 = 0). If a LMR command is issued the same operating parameters should be utilized as in step 11.
20. Wait at least  $t_{MRD}$  time, only NOPs or DESELECT commands are allowed.
21. At this point the DRAM is ready for any valid command. Note 200 clock cycles are required between step 11 (DLL Reset) and any READ command.

**Figure 9: Initialization Flow Diagram**

Figure 10: Component Case Temperature vs. Air Flow

NOTE:

1. Micron Technology, Inc. recommends a minimum air flow of 1 meter/second (~197 LFM) across all modules.
2. The component case temperature measurements shown above were obtained experimentally. The typical system to be used for experimental purposes is a dual-processor 600 MHz work station, fully loaded, with four comparable registered memory modules. Case temperatures charted represent worst-case component locations on modules installed in the internal slots of the system.
3. Temperature versus air speed data is obtained by performing experiments with the system motherboard removed from its case and mounted in a Eiffel-type low air speed wind tunnel. Peripheral devices installed on the system motherboard for testing are the processor(s) and video card, all other peripheral devices are mounted outside of the wind tunnel test chamber.
4. The memory diagnostic software used for determining worst-case component temperatures is a memory diagnostic software application developed for internal use by Micron Technology, Inc.

### SPD Clock and Data Conventions

Data states on the SDA line can change only during SCL LOW. SDA state changes during SCL HIGH are reserved for indicating start and stop conditions (as shown in Figure 11, Data Validity, and Figure 12, Definition of Start and Stop).

### SPD Start Condition

All commands are preceded by the start condition, which is a HIGH-to-LOW transition of SDA when SCL is HIGH. The SPD device continuously monitors the SDA and SCL lines for the start condition and will not respond to any command until this condition has been met.

### SPD Stop Condition

All communications are terminated by a stop condition, which is a LOW-to-HIGH transition of SDA when SCL is HIGH. The stop condition is also used to place the SPD device into standby power mode.

### SPD Acknowledge

Acknowledge is a software convention used to indicate successful data transfers. The transmitting device, either master or slave, will release the bus after transmitting eight bits. During the ninth clock cycle, the receiver will pull the SDA line LOW to acknowledge that it received the eight bits of data (as shown in Figure 13, Acknowledge Response From Receiver).

The SPD device will always respond with an acknowledge after recognition of a start condition and its slave address. If both the device and a WRITE operation have been selected, the SPD device will respond with an acknowledge after the receipt of each subsequent eight-bit word. In the read mode the SPD device will transmit eight bits of data, release the SDA line and monitor the line for an acknowledge. If an acknowledge is detected and no stop condition is generated by the master, the slave will continue to transmit data. If an acknowledge is not detected, the slave will terminate further data transmissions and await the stop condition to return to standby power mode.

**Table 15: EEPROM Device Select Code**

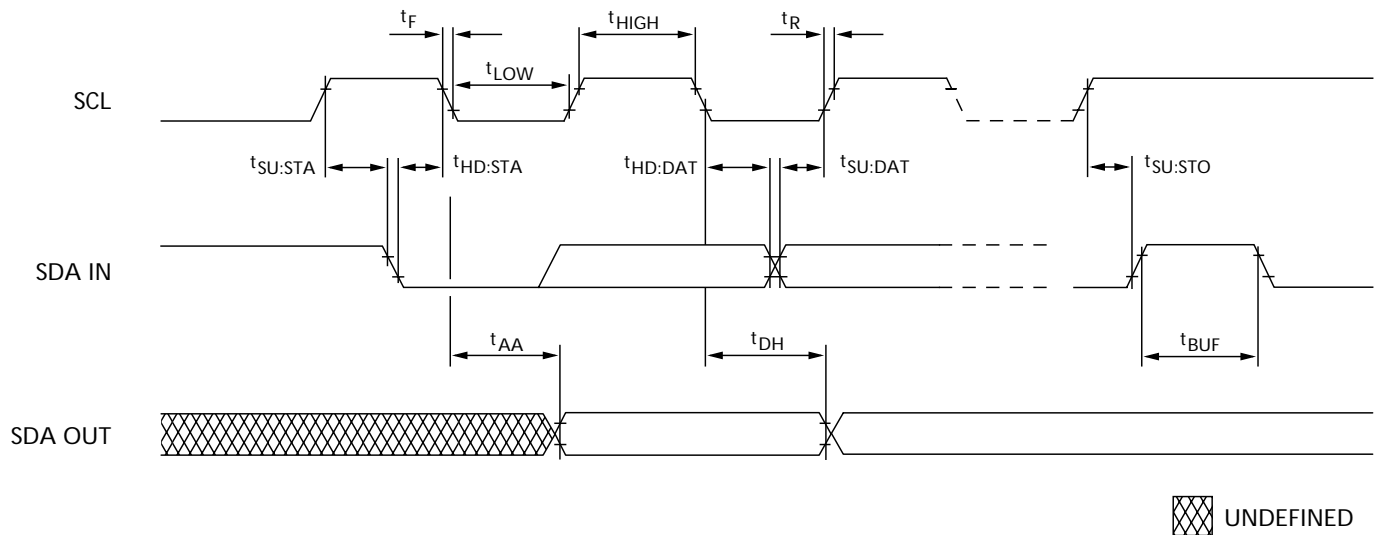

Most significant bit (b7) is sent first.

SELECT CODE	DEVICE TYPE IDENTIFIER				CHIP ENABLE			$\overline{RW}$
	b7	b6	b5	b4	b3	b2	b1	b0
Memory Area Select Code (two arrays)	1	0	1	0	SA2	SA1	SA0	$\overline{RW}$
Protection Register Select Code	0	1	1	0	SA2	SA1	SA0	$\overline{RW}$

**Table 16: EEPROM Operating Modes**

MODE	$\overline{RW}$ BIT	$\overline{WC}$	BYTES	INITIAL SEQUENCE
Current Address Read	1	$V_{IH}$ or $V_{IL}$	1	START, Device Select, $\overline{RW} = '1'$
Random Address Read	0	$V_{IH}$ or $V_{IL}$	1	START, Device Select, $\overline{RW} = '0'$ , Address
	1	$V_{IH}$ or $V_{IL}$	1	reSTART, Device Select, $\overline{RW} = '1'$
Sequential Read	1	$V_{IH}$ or $V_{IL}$	$\geq 1$	Similar to Current or Random Address Read
Byte Write	0	$V_{IL}$	1	START, Device Select, $\overline{RW} = '0'$
Page Write	0	$V_{IL}$	$\leq 16$	START, Device Select, $\overline{RW} = '0'$

**Figure 14: SPD EEPROM Timing Diagram**

**Table 17: Serial Presence-Detect EEPROM DC Operating Conditions**

 All voltages referenced to V<sub>SS</sub>; V<sub>DDSPD</sub> = +2.3V to +3.6V

PARAMETER/CONDITION	SYMBOL	MIN	MAX	UNITS
SUPPLY VOLTAGE	V <sub>DDSPD</sub>	2.3	3.6	V
INPUT HIGH VOLTAGE: Logic 1; All inputs	V <sub>IH</sub>	V <sub>DD</sub> × 0.7	V <sub>DD</sub> + 0.5	V
INPUT LOW VOLTAGE: Logic 0; All inputs	V <sub>IL</sub>	-1	V <sub>DD</sub> × 0.3	V
OUTPUT LOW VOLTAGE: I <sub>OUT</sub> = 3mA	V <sub>OL</sub>	-	0.4	V
INPUT LEAKAGE CURRENT: V <sub>IN</sub> = GND to V <sub>DD</sub>	I <sub>LI</sub>	-	10	μA
OUTPUT LEAKAGE CURRENT: V <sub>OUT</sub> = GND to V <sub>DD</sub>	I <sub>LO</sub>	-	10	μA
STANDBY CURRENT: SCL = SDA = V <sub>DD</sub> - 0.3V; All other inputs = V <sub>DD</sub> or V <sub>SS</sub>	I <sub>SB</sub>	-	30	μA
POWER SUPPLY CURRENT: SCL clock frequency = 100 KHz	I <sub>CC</sub>	-	2	mA

**Table 18: Serial Presence-Detect EEPROM AC Operating Conditions**

 All voltages referenced to V<sub>SS</sub>; V<sub>DDSPD</sub> = +2.3V to +3.6V

PARAMETER/CONDITION	SYMBOL	MIN	MAX	UNITS	NOTES
SCL LOW to SDA data-out valid	t <sub>AA</sub>	0.2	0.9	μs	1
Time the bus must be free before a new transition can start	t <sub>BUF</sub>	1.3		μs	
Data-out hold time	t <sub>DH</sub>	200		ns	
SDA and SCL fall time	t <sub>F</sub>		300	ns	2
Data-in hold time	t <sub>HD:DAT</sub>	0		μs	
Start condition hold time	t <sub>HD:STA</sub>	0.6		μs	
Clock HIGH period	t <sub>HIGH</sub>	0.6		μs	
Noise suppression time constant at SCL, SDA inputs	t <sub>I</sub>		50	ns	
Clock LOW period	t <sub>LOW</sub>	1.3		μs	
SDA and SCL rise time	t <sub>R</sub>		0.3	μs	2
SCL clock frequency	f <sub>SCL</sub>		400	KHz	
Data-in setup time	t <sub>SU:DAT</sub>	100		ns	
Start condition setup time	t <sub>SU:STA</sub>	0.6		μs	3
Stop condition setup time	t <sub>SU:STO</sub>	0.6		μs	
WRITE cycle time	t <sub>WRC</sub>		10	ms	4

NOTE:

1. To avoid spurious START and STOP conditions, a minimum delay is placed between SCL = 1 and the falling or rising edge of SDA.
2. This parameter is sampled.
3. For a reSTART condition, or following a WRITE cycle.
4. The SPD EEPROM WRITE cycle time (t<sub>WRC</sub>) is the time from a valid stop condition of a write sequence to the end of the EEPROM internal erase/program cycle. During the WRITE cycle, the EEPROM bus interface circuit is disabled, SDA remains HIGH due to pull-up resistor, and the EEPROM does not respond to its slave address.
