

**Parallel Optical Link:  
PAROLI® Tx AC, 1.6 Gbit/s**

**V23814-U1306-M130**

**Parallel Optical Link:  
PAROLI® Rx AC, 1.6 Gbit/s**

**V23815-U1306-M130**

### Features

- Power supply 3.3 V
- Low voltage differential signal electrical interface (LVDS)
- 12 electrical data channels
- Asynchronous, AC-coupled optical link
- 12 optical data channels
- Transmission data rate of up to 1600 Mbit/s per channel, total link data rate up to 19 Gbit/s
- 850 nm VCSEL array technology
- PIN diode array technology
- 62.5  $\mu\text{m}$  graded index multimode fiber ribbon
- MT based optical port
- SMD technology
- Class 1 FDA and IEC Class 1 laser safety compliant

### Optical Port

- Designed for the Simplex MT Connector (SMC)
- Port outside dimensions: 15.4 mm x 6.8 mm (width x height)
- MT compatible (IEC 61754-5) fiber spacing (250  $\mu\text{m}$ ) and alignment pin spacing (4600  $\mu\text{m}$ )
- Alignment pins fixed in module port
- Integrated mechanical keying
- Process plug (SMC dimensions) included with every module
- Cleaning of port and connector interfaces necessary prior to mating

**Features of the Simplex MT Connector (SMC)**

(as part of optional PAROLI fiber optic cables)

- Uses standardized MT ferrule (IEC 61754-5)
- MT compatible fiber spacing (250 µm) and alignment pin spacing (4600 µm)
- Snap-in mechanism
- Ferrule bearing spring loaded
- Integrated mechanical keying

**Applications**

Telecommunication

- Switching equipment
- Access network

Data Communication

- Interframe (rack-to-rack)
- Intraframe (board-to-board)
- On board (optical backplane)
- Interface to SCI and HIPPI 6400 standards

## Pin Configuration

The numbering conventions for the Tx and Rx modules are the same.

## Description

PAROLI is a parallel optical link for high-speed data transmission. A complete PAROLI system consists of a transmitter module, a 12-channel fiber optic cable, and a receiver module.

### Transmitter V23814-U1306-M130

The transmitter module converts parallel electrical input signals via a laser driver and a Vertical Cavity Surface Emitting Laser (VCSEL) diode array into parallel optical output signals. All input data signals are Low Voltage Differential Signals (LVDS). The data rate is up to 1600 Mbit/s for each channel. The transmitter module's min. data rate  $DR_{\min}$  depends on the disparity  $D$  and on the duty cycle of the electrical input data. If the duty cycle exceeds 57%, the channel will be shut down with a minimum response time of 1  $\mu$ s. (See "Laser Safety Design Considerations" on **Page 12**). If the input duty cycle does not exceed 57%, the channel will be switched off if the input data's maximal run length of '1' bits exceeds the response time of 1  $\mu$ s. In the worst case the input data's maximal running length of '1' bits equals its disparity  $D$ . From this we derive the following expression for  $DR_{\min}$ , the minimum data rate:

$$DR_{\min} = D \text{ [Mbit/s]}$$

#### Notes:

1. *The running disparity of a data stream is the difference of the number of ones and zeroes of that data stream. The disparity  $D$  is the maximum value of the running disparity for all possible starting points (with running disparity set to zero at the starting point) in the data stream.*
2. *The run length is the maximal number of consecutive ones or zeroes in a data stream. The run length is  $\leq$  the disparity  $D$ .*
3. *Important:  
 $DR_{\min}$  rate of the PAROLI link is higher than the value of  $DR_{\min}$  of the transmitter module, as  $DR_{\min}$  of the receiver module is higher.  
(See "Receiver V23815-U1306-M130" on **Page 11**)*

A logic low level at  $\text{-RESET}$  switches all laser outputs off. During power-up  $\text{-RESET}$  must be used as a power-on reset which disables the laser driver and laser control until the power supply has reached a 3 V level.

The Laser Controller Up (LCU) output is low if a laser fault is detected or  $\text{-RESET}$  is forced to low.

All Onondaga signals have LVCMOS levels.

Transmission delay of the PAROLI system is  $\leq 1$  ns for the transmitter,  $\leq 1$  ns for the receiver and approximately 5 ns per meter for the fiber optic cable.

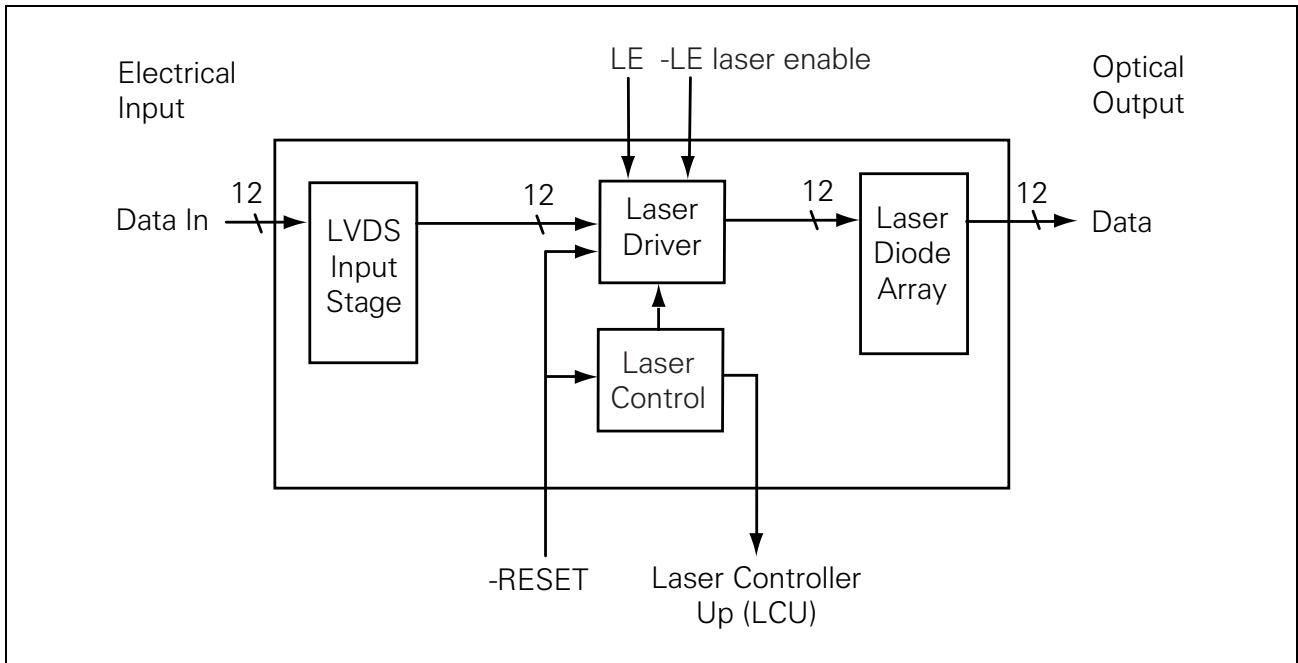

Figure 2 Transmitter Block Diagram

### Receiver V23815-U1306-M130

The PAROLI receiver module converts parallel optical input signals into parallel electrical output signals. The optical signals received are converted into voltage signals by PIN diodes, transimpedance amplifiers, and gain amplifiers. All output data signals are Low Voltage Differential Signals (LVDS).

The data rate is up to 1600 Mbit/s for each channel. The receiver module's min. data rate  $DR_{min}$  depends on the disparity  $D$  of the optical input data (coming from a transmitter module). It is given by the following expression:

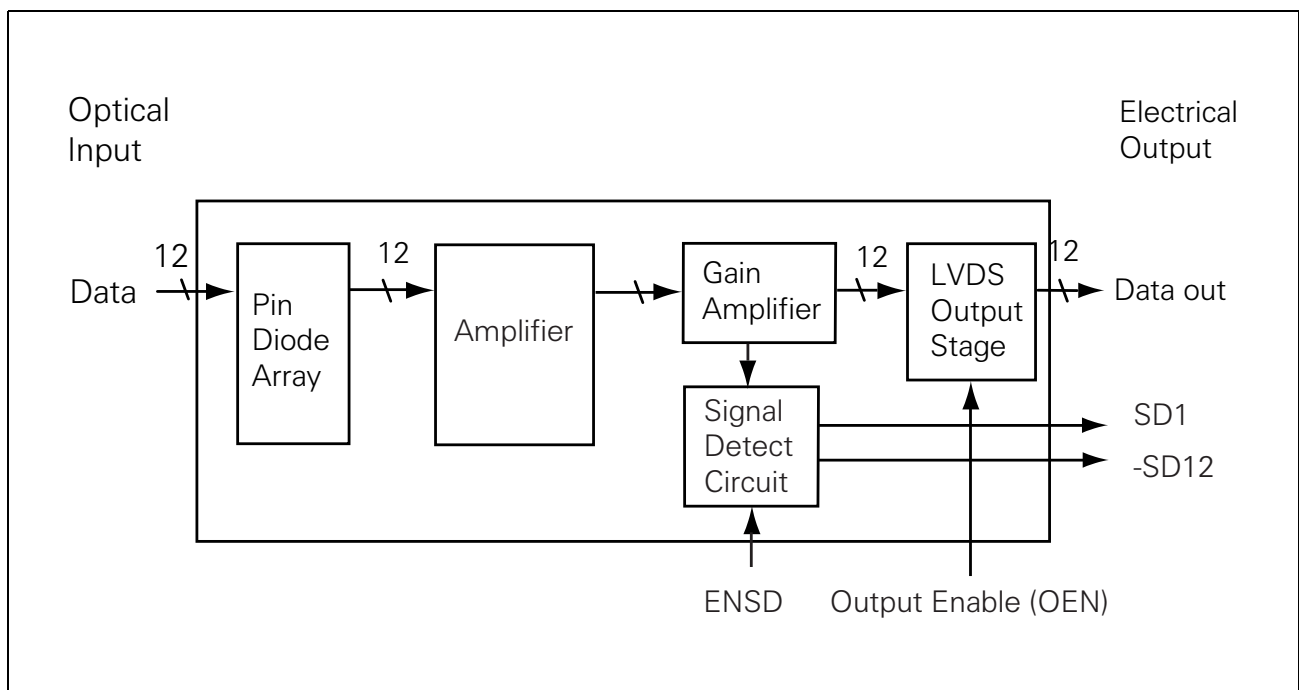

$$DR_{min} = 8 \cdot D \text{ [Mbit/s]}$$

*Note: The running disparity of a data stream is the difference of the number of ones and zeroes of that data stream. The disparity  $D$  is the maximum value of the running disparity for all possible starting points (with running disparity set to zero at the starting point) in the data stream.*

Additional Signal Detect outputs (SD1 active high / SD12 active low) show whether an optical AC input signal is present at data input 1 and/or 12. The signal detect circuit can be disabled with a logic low at ENSD. The disabled signal detect circuit will permanently generate an active level at Signal Detect outputs, even if there is insufficient signal input. This could be used for test purposes.

A logic low at LVDS Output Enable (OEN) sets all data outputs to logic low. SD outputs will not be effected.

All non data signals have LVCMOS levels. Transmission delay of the PAROLI system is at a maximum 1 ns for the transmitter, 1 ns for the receiver and approximately 5 ns per meter for the fiber optic cable.

**Figure 3 Receiver Block Diagram**

## Laser Safety

The transmitter of the AC coupled Parallel Optical Link (PAROLI) is an FDA Class 1 laser product. It complies with FDA regulations 21 CFR 1040.10 and 1040.11. The transmitter is also an IEC Class 1 laser product as defined by IEC 60825-1 Amend. 2. To avoid possible exposure to hazardous levels of invisible laser radiation, do not exceed maximum ratings.

The PAROLI module must be operated under the specified operating conditions (supply voltage between 3.0 V and 3.6 V, case temperature between 0°C and 80°C) under any circumstances to ensure laser safety.

### Attention: Class 1 Laser Product

*Note: Any modification of the module will be considered an act of “manufacturing,” and will require, under law, recertification of the product under FDA (21 CFR 1040.10 (i)).*

**Figure 4 Laser Emission**

## Laser Safety Design Considerations

To ensure laser safety for all input data patterns each channel is controlled internally and will be switched off if the laser safety limits are exceeded.

A channel alerter switches the respective data channel output off if the input duty cycle permanently exceeds 57%. The alerter will not disable the channel below an input duty cycle of 57% under all circumstances.

The minimum alerter response time is 1  $\mu$ s with a constant high input, i.e. in the input pattern the time interval of excessive high input (e.g. '1's in excess of a 57% duty cycle, consecutive or non-consecutive) must not exceed 1  $\mu$ s, otherwise the respective channel will be switched off. The alerter switches the respective channel from off to on without the need of resetting the module if the input duty cycle is no longer violated.

All of the channel alerters operate independently, i.e. an alert within a channel does not affect the other channels. To decrease the power consumption of the module unused channel inputs can be tied to high input level. In this way a portion of the supply current in this channel is triggered to shut down by the corresponding alerter.

## Technical Data

Stress beyond the values stated below may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods of time may affect device reliability.

### Absolute Maximum Ratings

Parameter	Symbol	Limit Values		Unit
		min.	max.	
Supply Voltage	$V_{CC}-V_{EE}$	-0.3	4.5	V
Data/Control Input Levels <sup>1)</sup>	$V_{IN}$	-0.5	$V_{CC}+0.5$	
LVDS Input Differential Voltage <sup>2)</sup>	$ V_{ID} $		2.0	
Operating Case Temperature <sup>3)</sup>	$T_{CASE}$	0	80	°C
Storage Ambient Temperature	$T_{STG}$	-20	100	
Operating Moisture		20	85	%
Storage Moisture		20	85	
Soldering Conditions Temp/Time <sup>4)</sup>	$T_{SOLD}$ , $t_{SOLD}$		260/10	°C/s
ESD Resistance (all pins to $V_{EE}$ , human body model) <sup>5)</sup>			1	kV

<sup>1)</sup> At LVDS and LVCMOS inputs.

<sup>2)</sup>  $|V_{ID}| = |(\text{input voltage of non-inverted input} - \text{input voltage of inverted input})|$ .

<sup>3)</sup> Measured at case temperature reference point (see Package Outlines **Figure 15**).

<sup>4)</sup> Hot bar or hot air soldering.

<sup>5)</sup> To avoid electrostatic damage, handling cautions similar to those used for MOS devices must be observed.

**Recommended Operating Conditions**

Parameter	Symbol	Limit Values		Unit
		min.	max.	
<b>Transmitter</b>				
Power Supply Voltage	$V_{CC}$	3.0	3.6	V
Noise on Power Supply <sup>1)</sup>	$N_{PS1}$		50	mV

LVC MOS Input Low Voltage	$V_{LVC MOSIL}$	$V_{EE}$	0.8	
LVC MOS Input Rise/Fall Time <sup>8)</sup>	$t_R, t_F$		20	ns
Optical Input Rise/Fall Time <sup>7)</sup>	$t_R, t_F$		400	ps
Input Extinction Ratio	ER	5.0		dB
Input Center Wavelength	$\lambda_C$	820	860	nm

Voltages refer to  $V_{EE} = 0$  V.

- <sup>1)</sup> Noise frequency is 1 kHz to 10 MHz. Voltage is peak-to-peak value.
- <sup>2)</sup> Noise frequency is > 10 MHz. Voltage is peak-to-peak value.
- <sup>3)</sup> This implies that the input stage can be AC coupled.
- <sup>4)</sup> Level diagram: see **Figure 5**
- <sup>5)</sup>  $|V_{ID}| = |(\text{input voltage of non-inverted input} - \text{input voltage of inverted input})|$ .
- <sup>6)</sup> Skew between positive and negative inputs measured at 50% level.
- <sup>7)</sup> 20% - 80% level.
- <sup>8)</sup> Measured between 0.8 V and 2.0 V.

Figure 5 Input Level Diagram

Figure 6 LVDS Input Stage

The electro-optical characteristics described in the following tables are valid only for use under the recommended operating conditions.

### Transmitter Electrical Characteristics

Parameter	Symbol	Limit Values			Unit
		min.	typ.	max.	
Supply Current	$I_{CC}$		350	450	mA
Power Consumption	$P$		1.2	1.6	W
Data Rate per Channel	$DR$	<sup>1)</sup>		1600	Mbit/s
LVC MOS Output Voltage Low	$V_{LVCMOSOL}$			0.4	V
LVC MOS Output Voltage High	$V_{LVCMOSOH}$	2.5

LVC MOS Output Current High <sup>2)</sup>	$I_{LVCMOSOH}$			0.5	mA
LVC MOS Output Current Low <sup>3)</sup>	$I_{LVCMOSOL}$			4.0	
LVDS Differential Input Impedance <sup>4)</sup>	$R_{IN}$	80		120	$\Omega$
LVDS Input Differential Current	$ I_I $			5.0	mA

<sup>1)</sup>  $DR_{min} = D$  [Mbit/s], with  $D$ : disparity of the input pattern. (See "Transmitter V23814-U1306-M130" on Page 9.)

<sup>2)</sup> Source current.

<sup>3)</sup> Sink current.

<sup>4)</sup> LVDS input stage.

### Transmitter Electro-Optical Characteristics

Parameter	Symbol	Limit Values			Unit
		min.	typ.	max.	
Optical Rise Time <sup>1)</sup>	$t_R$			400	ps
Optical Fall Time <sup>1)</sup>	$t_F$			400	
Random Jitter ( $14\sigma$ ) <sup>2)</sup>	$J_R$			0.23	UI
Deterministic Jitter	$J_D$			0.20	
Channel-to-channel skew <sup>3)</sup>	$t_{CSK}$			75	ps
Launched Average Power	$P_{AVG}$	-11.0		-5.0	dBm
Launched Power Shutdown	$P_{SD}$			-30.0	
Center Wavelength	$\lambda_C$	840		860	nm
Spectral Width (FWHM)	$\Delta\lambda$			2	
Spectral Width (rms)	$\Delta\lambda$			0.85	
Relative Intensity Noise	RIN			-116	dB/Hz
Extinction Ratio (dynamic)	ER	6.0			dB

Optical parameters valid for each channel.

- <sup>1)</sup> 20% - 80% level, measured using a GBE (Gigabit Ethernet) filter.
- <sup>2)</sup> Measured with 01010... (square) optical output pattern and in module thermal steady state status. Without cooling this steady state status is reached after approximately 10 minutes.
- <sup>3)</sup> With input channel-to-channel skew 0 ps and a maximum LVDS channel-to-channel average deviation and swing deviation of 5%.

Figure 7 Timing Diagram

Parameter	Symbol	Limit Values		Unit
		min.	max.	
–RESET on Delay Time	$t_1$		100	ms
–RESET off Delay Time	$t_2$		50	$\mu$ s
–RESET Low Duration <sup>1)</sup>	$t_3$	10		

<sup>1)</sup> Only when not used as power on reset. At any failure recovery, –RESET must be brought to low level for at least  $t_3$ .

### Receiver Electrical Characteristics

Parameter	Symbol	Limit Values			Unit
		min.	typ.	max.	
Supply Current	$I_{CC}$		250	350	mA
Power Consumption	$P$		0.8	1.3	W
LVDS Output Low Voltage <sup>1), 2)</sup>	$V_{LVDSOL}$	925			mV
LVDS Output High Voltage <sup>1), 2)</sup>	$V_{LVDSOH}$			1475	
LVDS Output Differential Voltage <sup>1), 2), 3)</sup>	$ V_{OD} $	250		400	
LVDS Output Offset Voltage <sup>1), 2), 4)</sup>	$V_{OS}$	1125		1275	
LVDS Rise/Fall Time <sup>5)</sup>	$t_R, t_F$			400	ps
LVC MOS Output Voltage Low	$I_{LVCMOSOL}$			400	mV
LVC MOS Output Voltage High	$I_{LVCMOSOH}$	2500			
LVC MOS Input Current High/Low	$I_{LVCMOSI}$	–500		500	$\mu$ A
LVC MOS Output Current High <sup>6)</sup>	$I_{LVCMOSOH}$			0.5	mA
LVC MOS Output Current Low <sup>7)</sup>	$I_{LVCMOSOL}$			4.0	
Random Jitter ( $14\sigma$ ) <sup>8), 9)</sup>	$J_R$			0.31	UI
Deterministic Jitter <sup>8)</sup>	$J_D$			0.08	
Channel-to-channel skew <sup>10)</sup>	$t_{CSK}$			75	ps

<sup>1)</sup> Level diagram: see **Figure 8**

<sup>2)</sup> LVDS output must be terminated differentially with  $R_t$ .

<sup>3)</sup>  $|V_{OD}| = |(\text{output voltage of non-inverted output minus output voltage of inverted output})|$ .

<sup>4)</sup>  $V_{OS} = 1/2 (\text{output voltage of inverted output} + \text{output voltage of non-inverted output})$ .

<sup>5)</sup> Measured between 20% and 80% level with a maximum capacitive load of 5 pF.

<sup>6)</sup> Source current

<sup>7)</sup> Sink current

<sup>8)</sup> With no optical input jitter.

<sup>9)</sup> At sensitivity limit of –18.0 dBm at infinite ER.

<sup>10)</sup> With input channel-to-channel skew 0 ps.

Return Loss of Receiver	$A_{RL}$	12		

Optical parameters valid for each channel.

<sup>1)</sup>  $DR_{min} = 8 \cdot D$  [Mbit/s], with  $D$ : disparity of the input pattern. (See "Receiver V23815-U1306-M130" on Page 11.)

<sup>2)</sup>  $D \leq 100$ , BER =  $10^{-12}$ , Extinction ratio = infinite.

<sup>3)</sup> Extinction ratio = infinite,

$P_{SDA}$ : Average optical power when SD switches from inactive to active.

$P_{SDD}$ : Average optical power when SD switches from active to inactive.

Figure 9 Timing Diagrams

Parameter	Symbol	max.	Unit
Signal Detect Deassert Time	$t_1$	10	$\mu\text{s}$
Signal Detect Assert Time	$t_2$	10	
LVDS Output Enable off Delay Time	$t_3$	20	ns
LVDS Output Enable on Delay Time	$t_4$	20	

## Assembly

On the next pages are some figures to assist the customer in designing his printed circuit board (PCB). **Figure 10** shows the mechanical dimensions of the PAROLI transmitter and receiver modules and **Figure 11** to **Figure 13** give the dimensions of the holes and solder pads on a customer PCB that are necessary to mount the modules on this PCB. Keeping the tolerances for the PCB given in **Figure 11** to **Figure 13** is required to properly attach the PAROLI transmitter and receiver module to the PCB.

Attachment to the customer PCB should be done with four M2 screws torqued to 0.25 Nm +0.05 Nm (see **Figure 10**, cross section B-B). The screw length  $a$  should be 3 to 4 mm plus the thickness  $b$  of the customer PCB.

Special care must be taken to remove residues from the soldering and washing process which can impact the mechanical function. Avoid the use of aggressive organic solvents like ketones, ethers, etc. Consult the supplier of the PAROLI modules and the supplier of the solder paste and flux for recommended cleaning solvents.

The following common cleaning solvents will not affect the module: deionized water, ethanol, and isopropyl alcohol. Air-drying is recommended to a maximum temperature of 150°C. Do not use ultrasonics.

During soldering, heat must be applied to the leads only, to ensure that the case temperature never exceeds 150°C. The module must be mounted with a hot-air or hot-bar soldering process using a SnPb solder type, e.g. Sn62Pb36Ag2, in accordance with ISO 9435.

Figure 10 Drawing of the PAROLI Transmitter and Receiver Module

Figure 11 Recommended Circuit Board Layout: Transmitter

**Figure 12 Recommended Circuit Board Layout: Receiver**

No electronic components are allowed on the customer PCB within the area covered by the PAROLI module and the jumper used to attach a ribbon fiber cable.

**Attention please!**

The information herein is given to describe certain components and shall not be considered as warranted characteristics.

Terms of delivery and rights to technical change reserved.

We hereby disclaim any and all warranties, including but not limited to warranties of non-infringement, regarding circuits, descriptions and charts stated herein.

Infineon Technologies is an approved CECC manufacturer.

**Information**

For further information on technology, delivery terms and conditions and prices please contact your nearest Infineon Technologies Office in Germany or our Infineon Technologies Representatives worldwide.

**Warnings**

Due to technical requirements components may contain dangerous substances. For information on the types in question please contact your nearest Infineon Technologies Office.

Infineon Technologies Components may only be used in life-support devices or systems with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system, or to affect the safety or effectiveness of that device or system. Life-support devices or systems are intended to be implanted in the human body, or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.
