## Connection Diagram

## Output Current Optimization Method

Maximum output current can be adjusted by applying bias voltage between brightness control pins as shown below.

	DC Bias Voltage	Output Current
<b>Luminance Max.</b>	0 Vdc	6.0 mA
<b>Luminance Min.</b>	4.5 Vdc	2.5 mA

## On/Off Control

The on/off control is achieved by using the on/off pin on the input side of SIPF200A-RH. The circuit for the remote on/off circuitry consists of an active low TTL switch. When the circuit is open, the IC Vcc is cut off. When the circuit is closed, IC Vcc is activated. A mechanical switch or a TTL/CMOS gate needs to be placed between the remote on/off pin and ground creating a condition where the circuit is closed to activate the inverter. Either one of the following will be required for the inverter to operate:

One recommended use of logic switch for remote on/off is shown in the diagram below. Electrical specification for on/off terminal is Low 0 to 0.4V, -0.4 mA or higher when switch is closed.

1. Tie on/off pin to ground.
2. Add mechanical switch between on/off pin and ground, close switch.
3. Add TTL/CMOS switch between on/off and ground. Circuit must be closed for unit to operate (as shown above right).
