

NUF2900MN

Two Line EMI Filter with ESD Protection for High Speed Data Interface

NUF2900MN is a two line EMI filter with ESD protection designed for high speed data interface. It offers greater than -30 dB attenuation at frequencies from 800 MHz to 6.0 GHz while supporting data rates as high as 250 Mbps (125 MHz).

Features

- Provides EMI Filtering and ESD Protection
- Maximum Data Rate up to 250 Mbps
- Maximum ESD Rating of:
5.0 kV (Contact)
- DFN8, 2x2 mm Package
- Moisture Sensitivity Level 1
- ESD Ratings: Machine Model = C
Human Body Model = 3B
- This is a Pb-Free Device*

Applications

- EMI Filtering and ESD Protection for High Speed Data Interface
- Serializer / Deserializer
- Camera Imager Interface
- High Resolution Color LCD Display

MAXIMUM RATINGS

Parameter	Symbol	Value	Unit
ESD Discharge IEC61000-4-2 Contact Discharge	V_{PP}	5.0	kV
Operating Temperature Range	T_{OP}	-40 to 85	°C
Storage Temperature Range	T_{stg}	-55 to 150	°C
Maximum Lead Temperature for Soldering Purposes (1.8 in from case for 10 s)	T_L	260	°C

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

Effective Capacitance Calculation

The capacitance of the NUF2900MN can be determined a number of ways. When evaluated using low frequency, low current capacitance measurement equipment C_{LINE} (line capacitance), it is determined to be approximately 33 pF. When used in systems that have signal rise and fall times of 1 ns or less $C_{EFFECTIVE}$ (effective capacitance), it is closer to 10.4 pF.

If the rise and fall times of a signal is determined by the capacitance of the NUF2900MN, then an "effective" capacitance can be calculated using the following function based on a simple "RC" combination.

$$V_{OUT} = V_{IN} \left(1 - e^{-\frac{t}{R_{Termination} C_{Effective}}} \right)$$

The rise time "t" is approximately 1.08 ns with $V_{OUT} \sim 88\%$ of V_{IN} where the network impedance is 50Ω . When solving for $C_{EFFECTIVE}$, the capacitance is found to be 10.4 pF.

$$C_{Effective} = \frac{-t}{R \times \ln\left(1 - \frac{V_{OUT}}{V_{IN}}\right)}$$

$$C_{Effective} = \frac{-1.08\text{ns}}{50 \times \ln(1 - 0.88)}$$

If the data signal source has a rise and fall time slower than 1 ns, the NUF2900MN will have a filtered output with a similar rise and fall time. $C_{EFFECTIVE}$ will scale accordingly as rise/fall times increase until it reaches C_{LINE} .
