

## LOW-NOISE, HIGH-VOLTAGE, CURRENT-FEEDBACK OPERATIONAL AMPLIFIERS

### FEATURES

- **Low Noise**
  - **2 pA/√Hz Noninverting Current Noise**
  - **10 pA/√Hz Inverting Current Noise**
  - **3 nV/√Hz Voltage Noise**
- **High Output Current Drive: 260 mA**
- **High Slew Rate: 1300 V/μs ( $R_L = 100 \Omega$ ,  $V_O = 8 V_{PP}$ )**
- **Wide Bandwidth: 90 MHz ( $G = 2$ ,  $R_L = 100 \Omega$ )**
- **Wide Supply Range:  $\pm 5 V$  to  $\pm 15 V$**
- **Power-Down Feature: (THS3110 Only)**

### APPLICATIONS

- **Video Distribution**
- **Power FET Driver**
- **Pin Driver**
- **Capacitive Load Driver**

### DESCRIPTION

The THS3110 and THS3111 are low-noise, high-voltage, current-feedback amplifiers designed to operate over a wide supply range of  $\pm 5 V$  to  $\pm 15 V$  for today's high performance applications.

The THS3110 features a power-down pin (PD) that puts the amplifier in low power standby mode, and lowers the quiescent current from 4.8 mA to 270  $\mu A$ .

These amplifiers provide well-regulated ac performance characteristics. The unity gain bandwidth of 100 MHz allows for good distortion characteristics below 10 MHz. Coupled with high 1300-V/ $\mu s$  slew rate, the THS3110 and THS3111 amplifiers allow for high output voltage swings at high frequencies.

The THS3110 and THS3111 are offered in the 8-pin SOIC (D), and the 8-pin MSOP (DGN) packages with PowerPAD™.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PowerPAD is a trademark of Texas Instruments.

All other trademarks are the property of their respective owners.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

NOTE: The device with the power-down option defaults to the ON state if no signal is applied to the PD pin. Additionally, the REF pin functional range is from V<sub>S-</sub> to (V<sub>S+</sub> - 4 V).

**AVAILABLE OPTIONS<sup>(1)</sup>**

T <sub>A</sub>	PACKAGED DEVICE		
	PLASTIC SMALL OUTLINE SOIC (D)	PLASTIC MSOP (DGN) <sup>(2)(3)</sup>	SYMBOL
0°C to +70°C	THS3110CD	THS3110CDGN	BJB
	THS3110CDR	THS3110CDGNR	
-40°C to +85°C	THS3110ID	THS3110IDGN	BIR
	THS3110IDR	THS3110IDGNR	
0°C to +70°C	THS3111CD	THS3111CDGN	BJA
	THS3111CDR	THS3111CDGNR	
-40°C to +85°C	THS3111ID	THS3111IDGN	BIS
	THS3111IDR	THS3111IDGNR	

- (1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or see the TI web site at [www.ti.com](http://www.ti.com).
- (2) Available in tape and reel. The **R** suffix standard quantity is 2500 (for example, THS3110CDGNR).
- (3) The PowerPAD is electrically isolated from all other pins.

**DISSIPATION RATINGS TABLE**

PACKAGE	Θ <sub>JC</sub> (°C/W)	Θ <sub>JA</sub> (°C/W)	POWER RATING T <sub>J</sub> = +125°C	
			T <sub>A</sub> = +25°C	T <sub>A</sub> = +85°C
D-8 <sup>(1)</sup>	38.3	95	1.05 W	421 mW
DGN-8 <sup>(2)</sup>	4.7	58.4	1.71 W	685 mW

- (1) This data was taken using the JEDEC standard low-K test PCB. For the JEDEC proposed high-K test PCB, the Θ<sub>JA</sub> is 95°C/W with power rating at T<sub>A</sub> = 25°C of 1.05 W.
- (2) This data was taken using 2 oz. trace and copper pad that is soldered directly to a 3 inch x 3 inch (76,2 mm x 76,2 mm) PCB. For further information, refer to the [Application Information](#) section of this data sheet.

## RECOMMENDED OPERATING CONDITIONS

		MIN	NOM	MAX	UNIT
Supply voltage	Dual supply	±5		±15	V
	Single supply	10		30	
Operating free-air temperature, $T_A$	Commercial	0		+70	°C
	Industrial	–40		+85	
Operating junction temperature, continuous operating temperature, $T_J$		–40		+125	
Normal storage temperature, $T_{stg}$		–40		+85	

## ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature (unless otherwise noted)<sup>(1)</sup>

		UNIT
Supply voltage, $V_{S-}$ to $V_{S+}$		33 V
Input voltage, $V_I$		± $V_S$
Differential input voltage, $V_{ID}$		± 4 V
Output current, $I_O$ <sup>(2)</sup>		300 mA
Continuous power dissipation		See <a href="#">Dissipation Ratings Table</a>
Maximum junction temperature, $T_J$ <sup>(3)</sup>		+150°C
Maximum junction temperature, continuous operation, long term reliability, $T_J$ <sup>(4)</sup>		+125°C
Operating free-air temperature, $T_A$	Commercial	0°C to +70°C
	Industrial	–40°C to +85°C
Storage temperature, $T_{stg}$		–65°C to +125°C
Lead temperature <sup>(5)</sup>		
ESD ratings:		
HBM		900
CDM		1500
MM		200

- (1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The THS3110 and THS3111 may incorporate a PowerPAD™ on the underside of the chip. This acts as a heatsink and must be connected to a thermally dissipating plane for proper power dissipation. Failure to do so may result in exceeding the maximum junction temperature which could permanently damage the device. See TI Technical Brief [SLMA002](#) for more information about utilizing the PowerPAD™ thermally enhanced package.
- (3) The absolute maximum temperature under any condition is limited by the constraints of the silicon process.
- (4) The maximum junction temperature for continuous operation is limited by package constraints. Operation above this temperature may result in reduced reliability and/or lifetime of the device.
- (5) See the MSL/Reflow Rating information provided with the material, or see TI's website at [www.ti.com](http://www.ti.com) for the latest information.

**ELECTRICAL CHARACTERISTICS**

$V_S = \pm 15\text{ V}$ ,  $R_F = 1\text{ k}\Omega$ ,  $R_L = 100\ \Omega$ , and  $G = 2$  (unless otherwise noted)

## APPLICATION INFORMATION

### MAXIMUM SLEW RATE FOR REPETITIVE SIGNALS

The THS3110 and THS3111 are recommended for high slew rate pulsed applications where the internal nodes of the amplifier have time to stabilize between pulses. It is recommended to have at least 20-ns delay between pulses.

The THS3110 and THS3111 are not recommended for applications with repetitive signals (sine, square, sawtooth, or other) that exceed 900 V/ $\mu$ s. Using the part in these applications results in excessive current draw from the power supply and possible device damage.

For applications with high slew rate, repetitive signals, the THS3091 and THS3095 (single), or THS3092 and THS3096 (dual) are recommended.

### WIDEBAND, NONINVERTING OPERATION

The THS3110 and THS3111 are unity gain stable 100-MHz current-feedback operational amplifiers, designed to operate from a  $\pm 5$ -V to  $\pm 15$ -V power supply.

Figure 51 shows the THS3111 in a noninverting gain of 2-V/V configuration typically used to generate the performance curves. Most of the curves were characterized using signal sources with 50- $\Omega$  source impedance, and with measurement equipment presenting a 50- $\Omega$  load impedance.

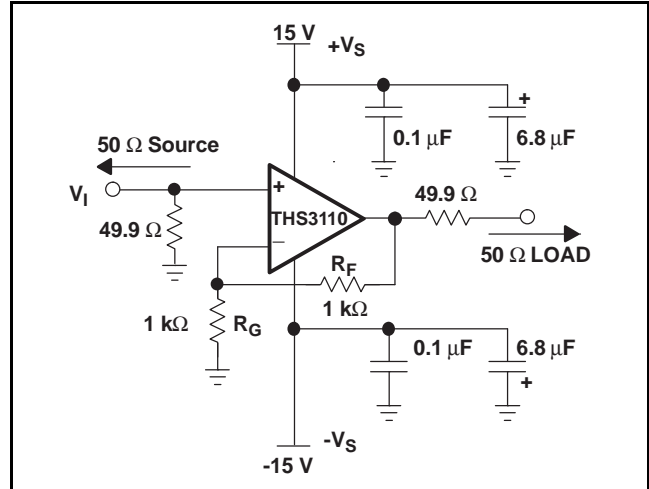

Figure 51. Wideband, Noninverting Gain Configuration

Current-feedback amplifiers are highly dependent on the feedback resistor  $R_F$  for maximum performance and stability. Table 1 shows the optimal gain setting resistors  $R_F$  and  $R_G$  at different gains to give maximum bandwidth with minimal peaking in the frequency response. Higher bandwidths can be achieved, at the expense of added peaking in the frequency response, by using even lower values for  $R_F$ . Conversely, increasing  $R_F$  decreases the bandwidth, but stability is improved.

Table 1. Recommended Resistor Values for Optimum Frequency Response

THS3110 and THS3111 $R_F$ and $R_G$ values for minimal peaking with $R_L = 100 \Omega$			
GAIN (V/V)	SUPPLY VOLTAGE (V)	$R_G$ ( $\Omega$ )	$R_F$ ( $\Omega$ )
1	$\pm 15$	--	1.5 k
	$\pm 5$	--	1.5 k
2	$\pm 15$	1 k	1 k
	$\pm 5$	1.15 k	1.15 k
5	$\pm 15$	200	806
	$\pm 5$	200	806
10	$\pm 15$	66.5	604
	$\pm 5$	66.5	604
-1	$\pm 15$	1 k	1 k
	$\pm 5$	1 k	1 k
-2	$\pm 15$ and $\pm 5$	549	1.1 k
-5	$\pm 15$ and $\pm 5$	182	909
-10	$\pm 15$ and $\pm 5$	64.9	649

**WIDEBAND, INVERTING OPERATION**

Figure 52 shows the THS3111 in a typical inverting gain configuration where the input and output impedances and signal gain from Figure 51 are retained in an inverting circuit configuration.

Figure 52. Wideband, Inverting Gain Configuration

**SINGLE-SUPPLY OPERATION**

The THS3110 and THS3111 have the capability to operate from a single-supply voltage ranging from 10 V to 30 V. When operating from a single power supply, biasing the input and output at mid-supply allows for the maximum output voltage swing. The circuits shown in Figure 53 shows inverting and noninverting amplifiers configured for single supply operations.

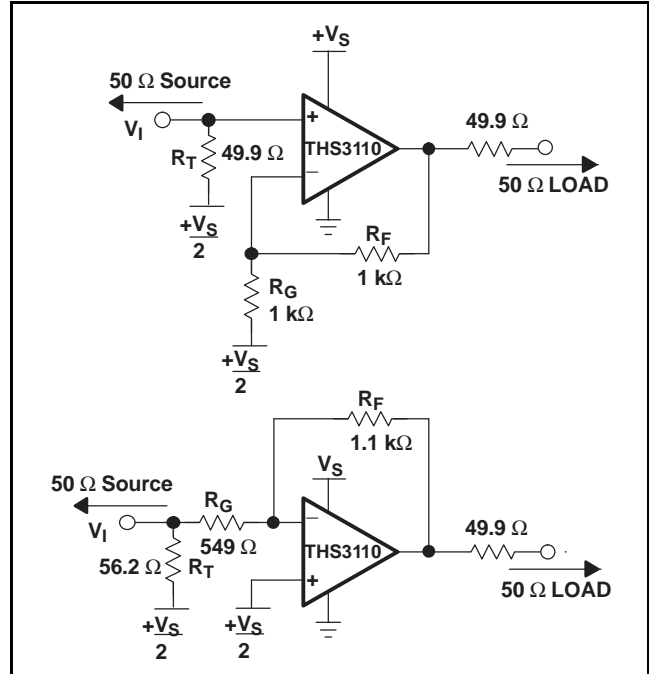

Figure 53. DC-Coupled, Single-Supply Operation

**Video Distribution**

The wide bandwidth, high slew rate, and high output drive current of the THS3110 and THS3111 matches the demands for video distribution for delivering video signals down multiple cables. To ensure high signal quality with minimal degradation of performance, a 0.1-dB gain flatness should be at least 7x the passband frequency to minimize group delay variations from the amplifier. A high slew rate minimizes distortion of the video signal, and supports component video and RGB video signals that require fast transition times and fast settling times for high signal quality.

Figure 54. Video Distribution Amplifier Application

### Driving Capacitive Loads

Applications, such as FET drivers and line drivers can be highly capacitive and cause stability problems for high-speed amplifiers.

Figure 55 through Figure 61 show recommended methods for driving capacitive loads. The basic idea is to use a resistor or ferrite chip to isolate the phase shift at high frequency caused by the capacitive load from the amplifier's feedback path. See Figure 55 for recommended resistor values versus capacitive load.

Figure 55. Recommended  $R_{ISO}$  vs Capacitive Load

Placing a small series resistor,  $R_{ISO}$ , between the amplifier's output and the capacitive load, as shown in Figure 56, is an easy way of isolating the load capacitance.

Figure 56.

Using a ferrite chip in place of  $R_{ISO}$ , as shown in Figure 57, is another approach of isolating the output of the amplifier. The ferrite's impedance characteristic versus frequency is useful to maintain the low

frequency load independence of the amplifier while isolating the phase shift caused by the capacitance at high frequency. Use a ferrite with similar impedance to  $R_{ISO}$ , 20  $\Omega$  – 50  $\Omega$ , at 100 MHz and low impedance at dc.

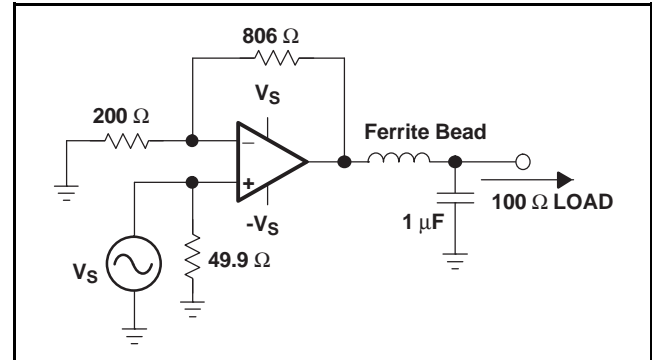

Figure 57.

Figure 58 shows another method used to maintain the low frequency load independence of the amplifier while isolating the phase shift caused by the capacitance at high frequency. At low frequency, feedback is mainly from the load side of  $R_{ISO}$ . At high frequency, the feedback is mainly via the 27-pF capacitor. The resistor  $R_{IN}$  in series with the negative input is used to stabilize the amplifier and should be equal to the recommended value of  $R_F$  at unity gain. Replacing  $R_{IN}$  with a ferrite of similar impedance at about 100 MHz as shown in Figure 59 gives similar results with reduced dc offset and low frequency noise. (See the *Additional Reference Materials* section for expanding the usability of current-feedback amplifiers.)

Figure 58.

Figure 59.

Figure 60 is shown using two amplifiers in parallel to double the output drive current to larger capacitive loads. This technique is used when more output current is needed to charge and discharge the load faster like when driving large FET transistors.

Figure 60.

Figure 61 shows a push-pull FET driver circuit typical of ultrasound applications with isolation resistors to isolate the gate capacitance from the amplifier.

Figure 61. PowerFET Drive Circuit

### SAVING POWER WITH POWER-DOWN FUNCTIONALITY AND SETTING THRESHOLD LEVELS WITH THE REFERENCE PIN

The THS3110 features a power-down pin (PD) which lowers the quiescent current from 4.8 mA down to 270  $\mu$ A, ideal for reducing system power.

The power-down pin of the amplifier defaults to the positive supply voltage in the absence of an applied voltage, putting the amplifier in the power-off mode of operation. To turn off the amplifier in an effort to conserve power, the power-down pin can be driven towards the positive rail. The threshold voltages for power-on and power-down are relative to the supply rails and are given in the specification tables. Below the *Enable Threshold Voltage*, the device is on. Above the *Disable Threshold Voltage*, the device is off. Behavior in between these threshold voltages is not specified.

Note that this power-down functionality is just that; the amplifier consumes less power in power-down mode. The power-down mode is not intended to provide a high-impedance output. In other words, the power-down functionality is not intended to allow use as a 3-state bus driver. When in power-down mode, the impedance looking back into the output of the amplifier is dominated by the feedback and gain setting resistors, but the output impedance of the device itself varies depending on the voltage applied to the outputs.

Figure 62 shows the total system output impedance which includes the amplifier output impedance in parallel with the feedback plus gain resistors, which cumulate to 1870 Ω. Figure 51 shows this circuit configuration for reference.

Figure 62. Power-Down Output Impedance vs Frequency

As with most current feedback amplifiers, the internal architecture places some limitations on the system when in power-down mode. Most notably is the fact that the amplifier actually turns ON if there is a ±0.7 V or greater difference between the two input nodes (V+ and V-) of the amplifier. If this difference exceeds ±0.7 V, the output of the amplifier creates an output voltage equal to approximately [(V+ - V-) - 0.7 V] × Gain. This also implies that if a voltage is applied to the output while in power-down mode, the V- node voltage is equal to  $V_{O(\text{applied})} \parallel R_G / (R_F + R_G)$ . For low gain configurations and a large applied voltage at the output, the amplifier may actually turn ON due to the aforementioned behavior.

The time delays associated with turning the device on and off are specified as the time it takes for the amplifier to reach either 10% or 90% of the final output voltage. The time delays are in the order of microseconds because the amplifier moves in and out of the linear mode of operation in these transitions.

## POWER-DOWN REFERENCE PIN OPERATION

In addition to the power-down pin, the THS3110 features a reference pin (REF) which allows the user to control the enable or disable power-down voltage levels applied to the PD pin. In most split-supply applications, the reference pin is connected to ground. In either case, the user needs to be aware of voltage-level thresholds that apply to the power-down pin. The tables below show examples and illustrate the relationship between the reference voltage and the power-down thresholds. In the table, the threshold levels are derived by the following equations:

$$PD \leq REF + 0.8 \text{ V for enable}$$

$$PD \geq REF + 2.0 \text{ V for disable}$$

where the usable range at the REF pin is

$$V_{S-} \leq V_{REF} \leq (V_{S+} - 4 \text{ V}).$$

The recommended mode of operation is to tie the REF pin to midrail, thus setting the enable/disable thresholds to  $V_{\text{midrail}} + 0.8 \text{ V}$  and  $V_{\text{midrail}} + 2 \text{ V}$  respectively.

POWER-DOWN THRESHOLD VOLTAGE LEVELS			
SUPPLY VOLTAGE (V)	REFERENCE PIN VOLTAGE (V)	ENABLE LEVEL (V)	DISABLE LEVEL (V)
±15, ±5	0.0	0.8	2.0
±15	2.0	2.8	4
±15	-2.0	-1.2	0
±5	1.0	1.8	3
±5	-1.0	-0.2	1
+30	15	15.8	17
+10	5.0	5.8	7

Note that if the REF pin is left unterminated, it will float to the positive rail and will fall outside of the recommended operating range given above ( $V_{S-} \leq V_{REF} \leq V_{S+} - 4 \text{ V}$ ). As a result, it will no longer serve as a reliable reference for the PD pin and the enable/disable thresholds given above will no longer apply. If the PD pin is also left unterminated, it will also float to the positive rail and the device will be disabled. If balanced, split supplies are used (±Vs) and the REF and PD pins are grounded, the device will be enabled.

## PRINTED-CIRCUIT BOARD LAYOUT TECHNIQUES FOR OPTIMAL PERFORMANCE

Achieving optimum performance with high frequency amplifier, like the THS3110 and THS3111, requires careful attention to board layout parasitic and external component types.

Recommendations that optimize performance include:

- Minimize parasitic capacitance to any ac ground for all of the signal I/O pins. Parasitic capacitance on the output and input pins can cause instability. To reduce unwanted capacitance, a window around the signal I/O pins should be opened in all of the ground and power planes around those pins. Otherwise, ground and power planes should be unbroken elsewhere on the board.
- Minimize the distance [ $< 0.25$  inch (6,35 mm)] from the power supply pins to high frequency 0.1- $\mu$ F and 100-pF decoupling capacitors. At the device pins, the ground and power plane layout should not be in close proximity to the signal I/O pins. Avoid narrow power and ground traces to minimize inductance between the pins and the decoupling capacitors. The power supply connections should always be decoupled with these capacitors. Larger (6.8  $\mu$ F or more) tantalum decoupling capacitors, effective at lower frequency, should also be used on the main supply pins. These may be placed somewhat farther from the device and may be shared among several devices in the same area of the PC board.
- Careful selection and placement of external components preserve the high frequency performance of the THS3110 and THS3111. Resistors should be a very low reactance type. Surface-mount resistors work best and allow a tighter overall layout. Again, keep their leads and PC board trace length as short as possible. Never use wirebound type resistors in a high frequency application. Since the output pin and inverting input pins are the most sensitive to parasitic capacitance, always position the feedback and series output resistors, if any, as close as possible to the inverting input pins and output pins. Other network components, such as input termination resistors, should be placed close to the gain-setting resistors. Even with a low parasitic capacitance shunting the external resistors, excessively high resistor values can create significant time constants that can degrade performance. Good axial metal-film or surface-mount resistors have approximately 0.2 pF in shunt with the resistor. For resistor values  $> 2.0$  k $\Omega$ , this parasitic capacitance can add a pole and/or a zero that can effect circuit operation. Keep resistor values as low as possible, consistent with load driving considerations.
- Connections to other wideband devices on the board may be made with short direct traces or through onboard transmission lines. For short connections, consider the trace and the input to the next device as a lumped capacitive load. Relatively wide traces [0.05 inch (1,3 mm) to 0.1 inch (2,54 mm)] should be used, preferably with ground and power planes opened up around them. Estimate the total capacitive load and determine if isolation resistors on the outputs are necessary. Low parasitic capacitive loads ( $< 4$  pF) may not need an  $R_S$  since the THS3110 and THS3111 are nominally compensated to operate with a 2-pF parasitic load. Higher parasitic capacitive loads without an  $R_S$  are allowed as the signal gain increases (increasing the unloaded phase margin). If a long trace is required, and the 6-dB signal loss intrinsic to a doubly-terminated transmission line is acceptable, implement a matched impedance transmission line using microstrip or stripline techniques (consult an ECL design handbook for microstrip and stripline layout techniques). A 50- $\Omega$  environment is not necessary onboard, and in fact, a higher impedance environment improves distortion as shown in the distortion versus load plots. With a characteristic board trace impedance based on board material and trace dimensions, a matching series resistor into the trace from the output of the THS3110 / THS3111 is used as well as a terminating shunt resistor at the input of the destination device. Remember also that the terminating impedance is the parallel combination of the shunt resistor and the input impedance of the destination device: this total effective impedance should be set to match the trace impedance. If the 6-dB attenuation of a doubly terminated transmission line is unacceptable, a long trace can be series-terminated at the source end only. Treat the trace as a capacitive load in this case. This does not preserve signal integrity as well as a doubly-terminated line. If the input impedance of the destination device is low, there is some signal attenuation due to the voltage divider formed by the series output into the terminating impedance.
- Socketing a high speed part like the THS3110 and THS3111 is not recommended. The additional lead length and pin-to-pin capacitance introduced by the socket can create an extremely troublesome parasitic network which can make it almost impossible to achieve a smooth, stable frequency response. Best results are obtained by soldering the THS3110 / THS3111 parts directly onto the board.

## PowerPAD™ DESIGN CONSIDERATIONS

The THS3110 and THS3111 are available in a thermally-enhanced PowerPAD family of packages. These packages are constructed using a downset leadframe upon which the die is mounted [see [Figure 63\(a\)](#) and [Figure 63\(b\)](#)]. This arrangement results in the lead frame being exposed as a thermal pad on the underside of the package [see [Figure 63\(c\)](#)]. Because this thermal pad has direct thermal contact with the die, excellent thermal performance can be achieved by providing a good thermal path away from the thermal pad. Note that devices such as the THS311x have no electrical connection between the PowerPAD and the die.

The PowerPAD package allows for both assembly and thermal management in one manufacturing operation. During the surface-mount solder operation (when the leads are being soldered), the thermal pad can also be soldered to a copper area underneath the package. Through the use of thermal paths within this copper area, heat can be conducted away from the package into either a ground plane or other heat dissipating device.

The PowerPAD package represents a breakthrough in combining the small area and ease of assembly of surface mount with the, heretofore, awkward mechanical methods of heatsinking.

**Figure 63. Views of Thermal Enhanced Package**

Although there are many ways to properly heatsink the PowerPAD package, the following steps illustrate the recommended approach.

**Figure 64. DGN PowerPAD PCB Etch and Via Pattern**  
Dimensions are in inches (mm)

## PowerPAD™ LAYOUT CONSIDERATIONS

1. PCB with a top side etch pattern as shown in [Figure 64](#). There should be etch for the leads as well as etch for the thermal pad.
2. Place five holes in the area of the thermal pad. These holes should be 0.01 inch (0,254 mm) in diameter. Keep them small so that solder wicking through the holes is not a problem during reflow.
3. Additional vias may be placed anywhere along the thermal plane outside of the thermal pad area. This helps dissipate the heat generated by the THS3110/THS3111 IC. These additional vias may be larger than the 0.01-inch (0,254 mm) diameter vias directly under the thermal pad. They can be larger because they are not in the thermal pad area to be soldered so that wicking is not a problem.
4. Connect all holes to the internal ground plane. Note that the PowerPAD is electrically isolated from the silicon and all leads. Connecting the PowerPAD to any potential voltage such as  $V_{S-}$ , is acceptable as there is no electrical connection to the silicon.
5. When connecting these holes to the ground plane, do not use the typical web or spoke via connection methodology. Web connections have a high thermal resistance connection that is useful for slowing the heat transfer during soldering operations. This makes the soldering of vias that have plane connections easier. In this application, however, low thermal resistance is desired for the most efficient heat transfer. Therefore, the holes under the THS3110 / THS3111 PowerPAD package should make their connection to the internal ground plane with a complete connection around the entire circumference of the plated-through hole.

6. The top-side solder mask should leave the terminals of the package and the thermal pad area with its five holes exposed. The bottom-side solder mask should cover the five holes of the thermal pad area. This prevents solder from being pulled away from the thermal pad area during the reflow process.
7. Apply solder paste to the exposed thermal pad area and all of the IC terminals.
8. With these preparatory steps in place, the IC is simply placed in position and run through the solder reflow operation as any standard surface-mount component. This results in a part that is properly installed.

**POWER DISSIPATION AND THERMAL CONSIDERATIONS**

The THS3110 and THS3111 incorporate automatic thermal shutoff protection. This protection circuitry shuts down the amplifier if the junction temperature exceeds approximately +160°C. When the junction temperature reduces to approximately +140°C, the amplifier turns on again. But, for maximum performance and reliability, the designer must take care to ensure that the design does not exceed a junction temperature of +125°C. Between +125°C and +150°C, damage does not occur, but the performance of the amplifier begins to degrade and long term reliability suffers. The thermal characteristics of the device are dictated by the package and the PC board. Maximum power dissipation for a given package can be calculated using the following formula.

$$P_{DMax} = \frac{T_{Max} - T_A}{\theta_{JA}} \tag{1}$$

Where:

- $P_{DMax}$  is the maximum power dissipation in the amplifier (W)
- $T_{Max}$  is the absolute maximum junction temperature (°C)
- $T_A$  is the ambient temperature (°C)
- $\theta_{JA} = \theta_{JC} + \theta_{CA}$
- $\theta_{JC}$  is the thermal coefficient from the silicon junctions to the case (°C/W)
- $\theta_{CA}$  is the thermal coefficient from the case to ambient air (°C/W)

For systems where heat dissipation is more critical, the THS3110 and THS3111 are offered in an 8-pin MSOP with PowerPAD package offering even better thermal performance. The thermal coefficient for the PowerPAD packages are substantially improved over the traditional SOIC.

Maximum power dissipation levels are depicted in Figure 65 for the available packages. The data for the PowerPAD packages assume a board layout that follows the PowerPAD layout guidelines referenced above and detailed in the PowerPAD application note (literature number SLMA002). Figure 65 also illustrates the effect of not soldering the PowerPAD to a PCB. The thermal impedance increases substantially which may cause serious heat and performance issues. Be sure to always solder the PowerPAD to the PCB for optimum performance.

Note: Results are with no airflow and PCB size = 3 in x 3 in (7,62 mm x 7,62 mm);  $\theta_{JA} = 58.4^\circ\text{C/W}$  for 8-pin MSOP with PowerPAD (DGN);  $\theta_{JA} = 95^\circ\text{C/W}$  for 8-pin SOIC High-K Test PCB (D);  $\theta_{JA} = 158^\circ\text{C/W}$  for 8-pin MSOP with PowerPAD, without solder.

**Figure 65. Maximum Power Distribution vs Ambient Temperature**

When determining whether or not the device satisfies the maximum power dissipation requirement, it is important to not only consider quiescent power dissipation, but also dynamic power dissipation. Often times, this is difficult to quantify because the signal pattern is inconsistent, but an estimate of the RMS power dissipation can provide visibility into a possible problem.

**DESIGN TOOLS**

**Evaluation Fixtures, Spice Models, and Application Support**

Texas Instruments is committed to providing its customers with the highest quality of applications support. To support this goal an evaluation board has been developed for the THS3110 and THS3111

operational amplifiers. The board is easy to use, allowing for straightforward evaluation of the device. The evaluation board can be ordered through the Texas Instruments web site, [www.ti.com](http://www.ti.com), or through your local Texas Instruments sales representative.

Computer simulation of circuit performance using SPICE is often useful when analyzing the performance of analog circuits and systems. This is particularly true for video and RF-amplifier circuits where parasitic capacitance and inductance can have a major effect on circuit performance. A SPICE model for the THS3111 is available through the Texas Instruments web site ([www.ti.com](http://www.ti.com)). The PIC is also available for design assistance and detailed product information. These models do a good job of predicting small-signal ac and transient performance under a wide variety of operating conditions. They are not intended to model the distortion characteristics of the amplifier, nor do they attempt to distinguish between the package types in their small-signal ac performance. Detailed information about what is and is not modeled is contained in the model file itself.

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered

at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PowerPAD™ PLASTIC SMALL-OUTLINE PACKAGE

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Body dimensions do not include mold flash or protrusion.
  - This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - Falls within JEDEC MO-187

PowerPAD is a trademark of Texas Instruments.

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

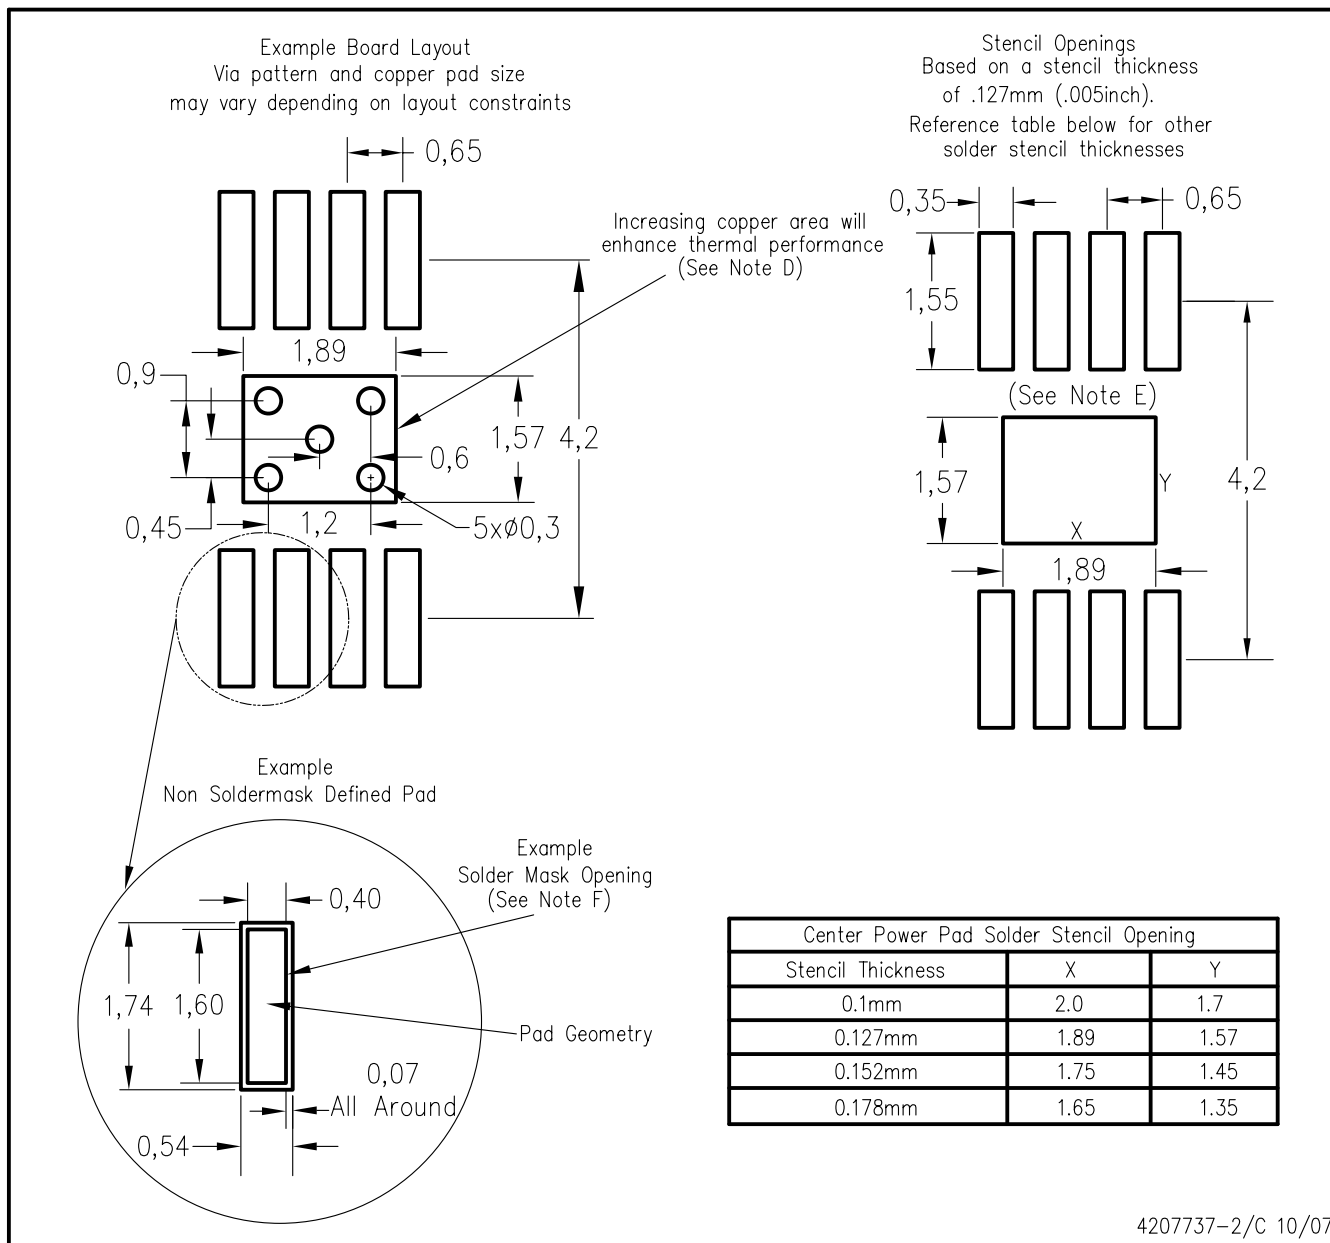

NOTE: All linear dimensions are in millimeters

Exposed Thermal Pad Dimensions

DGN (R-PDS0-G8) PowerPAD™

4207737-2/C 10/07

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
  - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>. Publication IPC-7351 is recommended for alternate designs.
  - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
  - F. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

D (R-PDSO-G8)

PLASTIC SMALL-OUTLINE PACKAGE

- NOTES:
- A. All linear dimensions are in inches (millimeters).
  - B. This drawing is subject to change without notice.
  - $\triangle C$  Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 (0,15) per end.
  - $\triangle D$  Body width does not include interlead flash. Interlead flash shall not exceed .017 (0,43) per side.
  - E. Reference JEDEC MS-012 variation AA.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
