

1.8-GHz, LOW DISTORTION, CURRENT FEEDBACK AMPLIFIER

FEATURES

- **Unity Gain Bandwidth: 1.8 GHz**
- **High Slew Rate: 6700 V/ μ s ($G = 2$ V/V, $R_L = 100 \Omega$, 5-V Step)**
- **IMD₃: –78 dBc at 20 MHz: ($G = 10$ V/V, $R_L = 100 \Omega$, 2- V_{PP} Envelope)**
- **Noise Figure: 11 dB ($G = 10$ V/V, $R_G = 28 \Omega$, $R_F = 255 \Omega$)**
- **Input-Referred Noise ($f > 10$ MHz)**
 - Voltage Noise: 1.65 nV/ $\sqrt{\text{Hz}}$
 - Noninverting Current Noise: 13.4 pA/ $\sqrt{\text{Hz}}$
 - Inverting Current Noise: 20 pA/ $\sqrt{\text{Hz}}$
- **Output Drive: 100 mA**
- **Power Supply Voltage Range: ± 3.3 V to ± 7.5 V**

APPLICATIONS

- Test and Measurement
- ATE
- High-Resolution, High-Sampling Rate ADC Drivers
- High-Resolution, High-Sampling Rate DAC Output Buffers

DESCRIPTION

The THS3201 is a wideband, high-speed current-feedback amplifier, designed to operate over a wide supply range of ± 3.3 V to ± 7.5 V for today's high performance applications.

The wide supply range, combined with low distortion and high slew rate, makes the THS3201 ideally suited for arbitrary waveform driver applications. The distortion performance also enables driving high-resolution and high-sampling rate ADCs.

Its high voltage operation capabilities make the THS3201 especially suitable for many test, measurement, and ATE applications where lower voltage devices do not offer enough voltage swing capability. Output rise and fall times are nearly independent of step size (to first-order approximation), making the THS3201 ideal for buffering small to large step pulses with excellent linearity in high dynamic systems.

The THS3201 is offered in a 5-pin SOT-23, 8-pin SOIC, and an 8-pin MSOP with PowerPAD™ packages.

RELATED DEVICES AND DESCRIPTIONS

DEVICE	DESCRIPTION
THS3202	± 7.5 -V, 2-GHz Dual Low Distortion CFB Amplifier
THS3001	± 15 -V, 420-MHz Low Distortion CFB Amplifier
THS3061/2	± 15 -V, 300-MHz Low Distortion CFB Amplifier
THS3122	± 15 -V, Dual CFB Amplifier With 350 mA Drive
OPA695	± 5 -V, 1.7-GHz Low Distortion CFB Amplifier

Low-Noise, Low-Distortion, Wideband Application Circuit

NOTE: Power supply decoupling capacitors not shown

NONINVERTING SMALL SIGNAL FREQUENCY RESPONSE

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PowerPAD is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ABSOLUTE MAXIMUM RATINGS

Over operating free-air temperature range unless otherwise noted.⁽¹⁾

		UNIT
V _S	Supply voltage	16.5 V
V _I	Input voltage	±V _S
I _O	Output current	175 mA
V _{ID}	Differential input voltage	±3 V
Continuous power dissipation		See Dissipation Rating Table
T _J	Maximum junction temperature ⁽²⁾	+150°C
T _J	Maximum junction temperature, continuous operation, long term reliability ⁽³⁾	+125°C
T _A	Operating free-air temperature range	–40°C to +85°C
T _{stg}	Storage temperature range	–65°C to +150°C
Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds		+300°C
ESD ratings	HBM	3000 V
	CDM	1500 V
	MM	100 V

- (1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.
- (2) The absolute maximum ratings under any condition is limited by the constraints of the silicon process. Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.
- (3) The maximum junction temperature for continuous operation is limited by package constraints. Operation above this temperature may result in reduced reliability and/or lifetime of the device.

PACKAGE DISSIPATION RATINGS⁽¹⁾

PACKAGE	θ _{JC} (°C/W)	θ _{JA} ⁽²⁾ (°C/W)	POWER RATING ⁽³⁾ (T _J = +125°C)	
			T _A ≤ +25°C	T _A = +85°C
DBV (5)	55	255.4	391 mW	156 mW
D (8)	38.3	97.5	1.02 W	410 mW
DGN (8) ⁽¹⁾	4.7	58.4	1.71 W	685 mW
DGK (8 pin)	54.2	260	385 mW	154 mW

- (1) The THS3201 may incorporate a PowerPAD™ on the underside of the chip. This acts as a heat sink and must be connected to a thermally dissipative plane for proper power dissipation. Failure to do so may result in exceeding the maximum junction temperature which could permanently damage the device. See TI technical briefs [SLMA002](#) and [SLMA004](#) for more information about utilizing the PowerPAD thermally enhanced package.
- (2) This data was taken using the JEDEC standard High-K test PCB.
- (3) Power rating is determined with a junction temperature of +125°C. This is the point where distortion starts to substantially increase. Thermal management of the final PCB should strive to keep the junction temperature at or below +125°C for best performance and long term reliability.

RECOMMENDED OPERATING CONDITIONS

		MIN	MAX	UNIT

APPLICATION INFORMATION

WIDEBAND, NONINVERTING OPERATION

The THS3201 is a unity gain stable, 1.8-GHz current-feedback operational amplifier, designed to operate from a $\pm 3.3\text{-V}$ to $\pm 7.5\text{-V}$ power supply.

Figure 55 shows the THS3201 in a noninverting gain of 2-V/V configuration typically used to generate the performance curves. Most of the curves were characterized using signal sources with 50- Ω source impedance, and with measurement equipment presenting a 50- Ω load impedance. The 49.9- Ω shunt resistor at the V_I terminal in Figure 55 matches the source impedance of the test generator.

Figure 55. Wideband, Noninverting Gain Configuration

Unlike voltage-feedback amplifiers, current-feedback amplifiers are highly dependent on the feedback resistor R_F for maximum performance and stability. Table 1 shows the optimal gain setting resistors R_F and R_G at different gains to give maximum bandwidth with minimal peaking in the frequency response. Higher bandwidths can be achieved, at the expense of added peaking in the frequency response, by using even lower values for R_F . Conversely, increasing R_F decreases the bandwidth, but stability is improved.

Table 1. Recommended Resistor Values for Optimum Frequency Response

THS3201 R_F for AC When $R_{load} = 100 \Omega$			
Gain (V/V)	Supply Voltage (V)	R_G (Ω)	R_F (Ω)
1	± 7.5	—	1.2 k
	± 5	—	1.2 k
2	± 7.5	768	768
	± 5	715	715
5	± 7.5	154.9	619
	± 5	143	576
10	± 7.5	54.9	487
	± 5	51.1	464
-1	± 7.5	619	619
	± 5	576	576
-2	± 7.5 and ± 5	287	576
-5	± 7.5 and ± 5	110	549
-10	± 7.5 and ± 5	49.9	499

WIDEBAND, INVERTING GAIN OPERATION

Figure 56 shows the THS3201 in a typical inverting gain configuration where the input and output impedances and signal gain from Figure 55 are retained in an inverting circuit configuration.

Figure 56. Wideband, Inverting Gain Configuration

SINGLE SUPPLY OPERATION

The THS3201 has the capability to operate from a single supply voltage ranging from 6.6 V to 15 V. When operating from a single power supply, care must be taken to ensure the input signal and amplifier are biased appropriately to allow for the maximum output voltage swing. The circuits shown in [Figure 57](#) demonstrate methods to configure an amplifier in a manner conducive for single supply operation

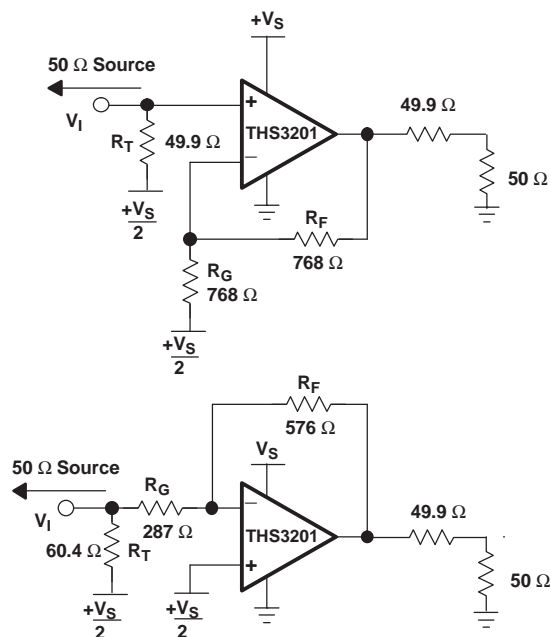

Figure 57. DC-Coupled Single Supply Operation

VIDEO HDTV DRIVERS

The exceptional bandwidth and slew rate of the THS3201 matches the demands for professional video and HDTV. Most commercial HDTV standards requires a video passband of 30-MHz. To ensure high signal quality with minimal degradation of performance, a 0.1-dB gain flatness should be at least 7x the passband frequency to minimize group delay variations—requiring 210-MHz 0.1-dB frequency flatness from the amplifier. High slew rates ensure there is minimal distortion of the video signal. Component video and RGB video signals require fast transition times and fast settling times to keep a high signal quality. The THS8135, for example, is a 240-MSPS video DAC and has a transition time approaching 4 ns. The THS3201 is a perfect candidate for interfacing the output of such high-performance video components.

Figure 58. Video Distribution Amplifier Application

ADC DRIVER APPLICATION

The THS3201 can be used as a high-performance ADC driver in applications like radio receiver IF stages, and test and measurement devices. All high-performance ADCs have differential inputs. The THS3201 can be used in conjunction with a transformer as a drive amplifier in these applications. [Figure 59](#) and [Figure 60](#) show two different approaches.

In [Figure 59](#), a transformer is used after the amplifier to convert the signal to differential. The advantage of this approach is fewer components are required. R_{OUT} and R_T are required for impedance matching the transformer.

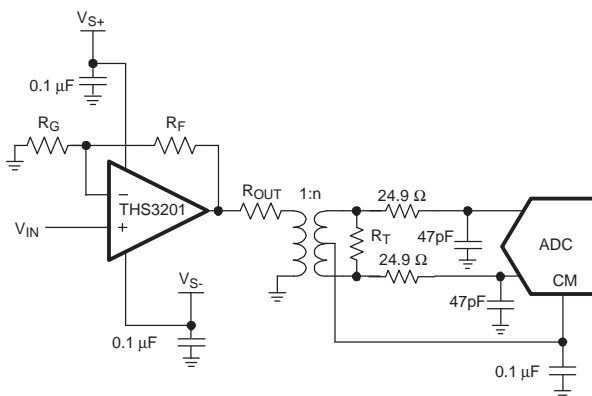

Figure 59. Differential ADC Driver Circuit 1

In [Figure 60](#), a transformer is used before two amplifiers to convert the signal to differential. The two amplifiers then amplify the differential signal. The advantage to this approach is each amplifier is required to drive half the voltage as before. R_T is used to impedance match the transformer.

Figure 60. Differential ADC Driver Circuit 2

It is almost universally recommended to use a resistor and capacitor between the op amp output and the ADC input as shown in both figures.

This resistor-capacitor (RC) combination has multiple functions:

- The capacitor is a local charge reservoir for ADC
- The resistor isolates the amplifier from the ADC
- In conjunction, they form a low-pass noise filter

During the sampling phase, current is required to charge the ADC input sampling capacitors. By placing external capacitors directly at the input pins, most of the current is drawn from them. They are seen as a very low impedance source. They can be thought of as serving much the same purpose as a power-supply bypass capacitor to supply transient current, with the amplifier then providing the bulk charge.

Typically, a low-value capacitor in the range of 10 pF to 100 pF provides the required transient charge reservoir.

The capacitance and the switching action of the ADC is one of the worst loading scenarios that a high-speed amplifier encounters. The resistor provides a simple means of isolating the associated phase shift from the feedback network and maintaining the phase margin of the amplifier.

Typically, a low value resistor in the range of 10 Ω to 100 Ω provides the required isolation. Together, the R and C form a real pole in the s-plane located at the frequency:

$$f_p = \frac{1}{2\pi RC}$$

Placing this pole at about 10x the highest frequency of interest ensures it has no impact on the signal. Since the resistor is typically a small value, it is very bad practice to place the pole at (or very near) frequencies of interest. At the pole frequency, the amplifiers sees a load with a magnitude of:

$$\sqrt{2} \times R$$

If R is only 10 Ω, the amplifier is very heavily loaded above the pole frequency, and generates excessive distortion.

DAC DRIVER APPLICATION

The THS3201 can be used as a high-performance DAC output driver in applications like radio transmitter stages and arbitrary waveform generators. All high-performance DACs have differential current outputs. Two THS3201s can be used as a differential drive amplifier in these applications, as shown in Figure 61.

R_{PU} on the DAC output is used to convert the output current to voltage. The 24.9-Ω resistor and 47-pF capacitor between each DAC output and the op amp input is used to reduce the images generated at multiples of the sampling rate. The values shown form a pole at 136 MHz. R_{OUT} sets the output impedance of each amplifier.

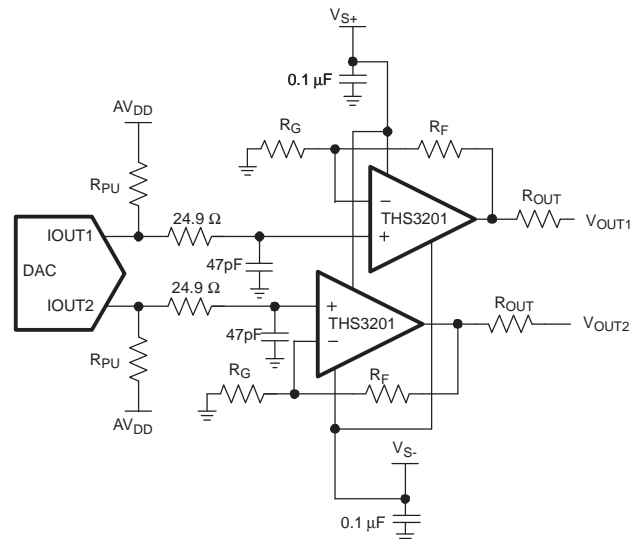

Figure 61. Differential DAC Driver Circuit

PRINTED CIRCUIT BOARD LAYOUT TECHNIQUES FOR OPTIMAL PERFORMANCE

Achieving optimum performance with high frequency amplifier-like devices in the THS3201 requires careful attention to board layout parasitic and external component types.

Recommendations that optimize performance include:

- Minimize parasitic capacitance to any power or ground plane for the negative input and output pins by voiding the area directly below these pins and connecting traces and the feedback path. Parasitic capacitance on the output and negative input pins can cause instability. To reduce unwanted capacitance, a window around the signal I/O pins should be opened in all of the ground and power planes around those pins and the feedback path. Otherwise, ground and power planes should be unbroken elsewhere on the board.
 - Minimize the distance (<0.25") from the power supply pins to high frequency 0.1- μ F and 100 pF decoupling capacitors. At the device pins, the ground and power plane layout should not be in close proximity to the signal I/O pins. Avoid narrow power and ground traces to minimize inductance between the pins and the decoupling capacitors. The power supply connections should always be decoupled with these capacitors. Larger (6.8 μ F or more) tantalum decoupling capacitors, effective at lower frequency, should also be used on the main supply pins. These may be placed somewhat farther from the device and may be shared among several devices in the same area of the printed circuit board (PCB). The primary goal is to minimize the impedance seen in the differential-current return paths. For driving differential loads with the THS3201, adding a capacitor between the power supply pins improves 2nd order harmonic distortion performance. This also minimizes the current loop formed by the differential drive.
 - Careful selection and placement of external components preserve the high frequency performance of the THS3201. Resistors should be a very low reactance type. Surface-mount resistors work best and allow a tighter overall layout. Again, keep their leads and PCB trace length as short as possible. Never use wirebound type resistors in a high frequency application. Since the output pin and inverting input pins are the most sensitive to parasitic capacitance, always position the feedback and series output resistors, if any, as close as possible to the inverting input pins and output pins. Other network components, such as input termination resistors, should be placed close to the gain- setting resistors. Even with a low parasitic capacitance shunting the external resistors, excessively high resistor values can create significant time constants that can degrade performance. Good axial metal-film or surface-mount resistors have approximately 0.2 pF in shunt with the resistor. For resistor values >2.0 k Ω this parasitic capacitance can add a pole and/or a zero that can affect circuit operation. Keep resistor values as low as possible, consistent with load driving considerations.
 - Connections to other wideband devices on the board may be made with short direct traces or through onboard transmission lines. For short connections, consider the trace and the input to the next device as a lumped capacitive load. Relatively wide traces (50 mils to 100 mils) should be used, preferably with ground and power planes opened up around them. Estimate the total capacitive load and determine if isolation resistors on the outputs are necessary. Low parasitic capacitive loads (< 4 pF) may not need an R_S since the THS3201 is nominally compensated to operate with a 2-pF parasitic load. Higher parasitic capacitive loads without an R_S are allowed as the signal gain increases (increasing the unloaded phase margin). If a long trace is required, and the 6-dB signal loss intrinsic to a doubly-terminated transmission line is acceptable, implement a matched impedance transmission line using microstrip or stripline techniques (consult an ECL design handbook for microstrip and stripline layout techniques).
 - A 50- Ω environment is not necessary onboard, and in fact, a higher impedance environment improves distortion as shown in the distortion versus load plots. With a characteristic board trace impedance based on board material and trace dimensions, a matching series resistor into the trace from the output of the THS3201 is used as well as a terminating shunt resistor at the input of the destination device.
- Remember also that the terminating impedance is the parallel combination of the shunt resistor and the input impedance of the destination device: this total effective impedance should be set to match the trace impedance. If the 6-dB attenuation of a doubly terminated transmission line is unacceptable, a long trace can be series-terminated at the source end only. Treat the trace as a capacitive load in this case. This does not preserve signal integrity as well as a doubly-terminated line. If the input impedance of the destination device is low, there is some signal attenuation due to the voltage divider formed by the series output into the terminating impedance.

- Socketing a high speed part like the THS3201 is not recommended. The additional lead length and pin-to-pin capacitance introduced by the socket can create an extremely troublesome parasitic network which can make it almost impossible to achieve a smooth, stable frequency response. Best results are obtained by soldering the THS3201 parts directly onto the board.

PowerPAD DESIGN CONSIDERATIONS

The THS3201 is available in a thermally-enhanced PowerPAD family of packages. These packages are constructed using a downset leadframe upon which the die is mounted [see Figure 62(a) and Figure 62(b)]. This arrangement results in the lead frame being exposed as a thermal pad on the underside of the package [see Figure 62(c)]. Because this thermal pad has direct thermal contact with the die, excellent thermal performance can be achieved by providing a good thermal path away from the thermal pad.

The PowerPAD package allows for both assembly and thermal management in one manufacturing operation. During the surface-mount solder operation (when the leads are being soldered), the thermal pad can also be soldered to a copper area underneath the package. Through the use of thermal paths within this copper area, heat can be conducted away from the package into either a ground plane or other heat dissipating device.

The PowerPAD package represents a breakthrough in combining the small area and ease of assembly of surface mount with the, heretofore, awkward mechanical methods of heatsinking.

Figure 62. Views of Thermally Enhanced Package

Although there are many ways to properly heatsink the PowerPAD package, the following steps illustrate the recommended approach.

Figure 63. DGN PowerPAD PCB Etch and Via Pattern

PowerPAD PCB LAYOUT CONSIDERATIONS

1. Prepare the PCB with a top side etch pattern as shown in Figure 63. There should be etch for the leads as well as etch for the thermal pad.
2. Place five holes in the area of the thermal pad. These holes should be 10 mils in diameter. Keep them small so that solder wicking through the holes is not a problem during reflow.
3. Additional vias may be placed anywhere along the thermal plane outside of the thermal pad area. This helps dissipate the heat generated by the THS3201 IC. These additional vias may be larger than the 10-mil diameter vias directly under the thermal pad. They can be larger because they are not in the thermal pad area to be soldered so that wicking is not a problem.
4. Connect all holes to the internal ground plane.
5. When connecting these holes to the ground plane, **do not** use the typical web or spoke via connection methodology. Web connections have a high thermal resistance connection that is useful for slowing the heat transfer during soldering operations. This makes the soldering of vias that have plane connections easier. In this application, however, low thermal resistance is desired for the most efficient heat transfer. Therefore, the holes under the THS3201 PowerPAD package should make their connection to the internal ground plane with a complete connection around the entire circumference of the plated-through hole.
6. The top-side solder mask should leave the terminals of the package and the thermal pad area with its five holes exposed. The bottom-side solder mask should cover the five holes of the thermal pad area. This prevents solder from

being pulled away from the thermal pad area during the reflow process.

7. Apply solder paste to the exposed thermal pad area and all of the IC terminals.
8. With these preparatory steps in place, the IC is simply placed in position and run through the solder reflow operation as any standard surface-mount component. This results in a part that is properly installed.

POWER DISSIPATION AND THERMAL CONSIDERATIONS

To maintain maximum output capabilities, the THS3201 does not incorporate automatic thermal shutoff protection. The designer must take care to ensure that the design does not violate the absolute maximum junction temperature of the device. Failure may result if the absolute maximum junction temperature of +150°C is exceeded. For best performance, design for a maximum junction temperature of +125°C. Between +125°C and +150°C, damage does not occur, but the performance of the amplifier begins to degrade.

The thermal characteristics of the device are dictated by the package and the PCB. Maximum power dissipation for a given package can be calculated using the following formula.

$$P_{DMax} = \frac{T_{Max} - T_A}{\theta_{JA}}$$

Where:

- P_{DMax} is the maximum power dissipation in the amplifier (W)
- T_{Max} is the absolute maximum junction temperature (°C)
- T_A is the ambient temperature (°C)
- $\theta_{JA} = \theta_{JC} + \theta_{CA}$
- θ_{JC} is the thermal coefficient from the silicon junctions to the case (°C/W)
- θ_{CA} is the thermal coefficient from the case to the ambient air (°C/W)

For systems where heat dissipation is more critical, the THS3201 is offered in an 8-pin MSOP with PowerPAD and also available in the SOIC-8 PowerPAD package, offering even better thermal performance. The thermal coefficients for the PowerPAD packages are substantially improved over the traditional SOIC. Maximum power dissipation levels are depicted in the graph for the available packages. The data for the PowerPAD packages assume a board layout that follows the PowerPAD layout guidelines referenced above and detailed in the PowerPAD application note number [SLMA002](#). The following graph also illustrates the effect of not soldering the PowerPAD to a PCB. The thermal impedance increases substantially which may cause serious heat and performance issues. Be sure to always solder the PowerPAD to the PCB for optimum performance.

Results are With No Air Flow and PCB Size = 3"x3"
 $\theta_{JA} = 58.4^{\circ}\text{C/W}$ for 8-Pin MSOP w/PowerPad (DGN)
 $\theta_{JA} = 98^{\circ}\text{C/W}$ for 8-Pin SOIC High Test PCB (D)
 $\theta_{JA} = 158^{\circ}\text{C/W}$ for 8-Pin MSOP w/PowerPad w/o Solder

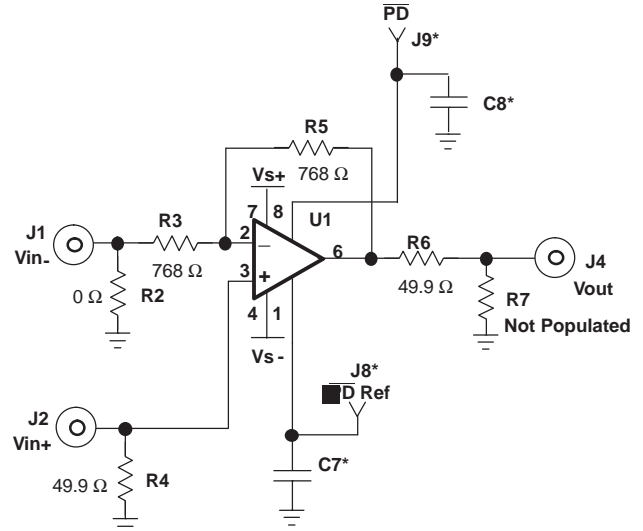

Figure 64. Maximum Power Dissipation vs Ambient Temperature

When determining whether or not the device satisfies the maximum power dissipation requirement, it is important to not only consider quiescent power dissipation, but also dynamic power dissipation. Often times, this is difficult to quantify because the signal pattern is inconsistent, but an estimate of the RMS power dissipation can provide visibility into a possible problem.

DESIGN TOOLS

Evaluation Fixture, Spice Models, and Applications Support

Texas Instruments is committed to providing its customers with the highest quality of applications support. To support this goal an evaluation board has been developed for the THS3201 operational amplifier. The board is easy to use, allowing for straightforward evaluation of the device. The evaluation board can be ordered through the Texas Instruments web site at www.ti.com, or through your local Texas Instruments sales representative. The schematic diagram, board layers, and bill of materials of the evaluation boards are provided below.

Computer simulation of circuit performance using SPICE is often useful when analyzing the performance of analog circuits and systems. This is particularly true for video and R_F -amplifier circuits where parasitic capacitance and inductance can have a major effect on circuit performance. A SPICE model for the THS3201 family of devices is available through the Texas Instruments web site (www.ti.com). The Product Information Center (PIC) is available for design assistance and detailed product information. These models do a good job of predicting small-signal ac and transient performance under a wide variety of operating conditions. They are not intended to model the distortion characteristics of the amplifier, nor do they attempt to distinguish between the package types in their small-signal ac performance. Detailed information about what is and is not modeled is contained in the model file itself.

EVM WARNINGS AND RESTRICTIONS

It is important to operate this EVM within the input voltage and the output voltage ranges as specified in the table below.

Input Range, V_S	6.6 V ($\pm 3.3V$) to 16.5V ($\pm 8.25V$)
Input Range, V_I	NOT TO EXCEED: Power Supply Voltage Applied
Output Range, V_O	NOT TO EXCEED: Power Supply Voltage Applied

Exceeding the specified input range may cause unexpected operation and/or irreversible damage to the EVM. If there are questions concerning the input range, please contact a TI field representative prior to connecting the input power.

Applying loads outside of the specified output range may result in unintended operation and/or possible permanent damage to the EVM. Please consult the EVM User's Guide prior to connecting any load to the EVM output. If there is uncertainty as to the load specification, please contact a TI field representative.

During normal operation, some circuit components may have case temperatures greater than 125°C. The EVM is designed to operate properly with certain components above 125°C as long as the input and output ranges are maintained. These components include but are not limited to linear regulators, switching transistors, pass transistors, and current sense resistors. These types of devices can be identified using the EVM schematic located in the EVM User's Guide. When placing measurement probes near these devices during operation, please be aware that these devices may be very warm to the touch.

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS

compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

NOTE: All linear dimensions are in millimeters

Exposed Thermal Pad Dimensions

DGN (R-PDS0-G8) PowerPAD™

4207737-2/C 10/07

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>. Publication IPC-7351 is recommended for alternate designs.
 - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
 - F. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

D (R-PDSO-G8)

PLASTIC SMALL-OUTLINE PACKAGE

- NOTES:
- A. All linear dimensions are in inches (millimeters).
 - B. This drawing is subject to change without notice.
 - C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 (0,15) per end.
 - D. Body width does not include interlead flash. Interlead flash shall not exceed .017 (0,43) per side.
 - E. Reference JEDEC MS-012 variation AA.

DGK (S-PDSO-G8)

PLASTIC SMALL-OUTLINE PACKAGE

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 per end.
 - D. Body width does not include interlead flash. Interlead flash shall not exceed 0.50 per side.
 - E. Falls within JEDEC MO-187 variation AA, except interlead flash.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
