

## WIDEBAND, LOW NOISE, LOW DISTORTION FULLY DIFFERENTIAL AMPLIFIER

### FEATURES

- Fully Differential Architecture
- Common-Mode Input Range Includes the Negative Rail
- Unity Gain Stable
- Bandwidth: 1.6 GHz (Gain = 0 dB)
- Slew Rate: 4900 V/s
- 1% Settling Time: 3.3 ns
- HD<sub>2</sub>: –72 dBc at 70 MHz
- HD<sub>3</sub>: –87 dBc at 70 MHz
- OIP<sub>2</sub>: 76 dBm at 70 MHz
- OIP<sub>3</sub>: 42 dBm at 70 MHz
- Input Voltage Noise: 2 nV/√Hz (f > 10 MHz)
- Noise Figure: 21.8 dB (50 Ω System, G = 6 dB)
- Output Common-Mode Control
- 5-V Power Supply Current: 39.2 mA
- Power-Down Capability: 0.65 mA

### APPLICATIONS

- 5-V Data-Acquisition Systems
- High Linearity ADC Amplifier
- Wireless Communication
- Medical Imaging
- Test and Measurement

### RELATED PRODUCTS

Device	Min. Gain	Common Mode Range of Input*
THS4508	6 dB	–0.3V to 2.3V
THS4509	6 dB	0.75V to 4.25V
THS4511	0 dB	–0.3V to 2.3V
THS4513	0 dB	0.75V to 4.25V

\*Note: Assumes a 5V single-ended power supply

### DESCRIPTION

The THS4511 is a wideband, fully-differential operational amplifier designed for single-supply 5-V data-acquisition systems. It has very low noise at 2 nV/√Hz, and extremely low harmonic distortion of –72 dBc HD<sub>2</sub> and –87 dBc HD<sub>3</sub> at 70 MHz with 2 V<sub>pp</sub>, G = 0 dB, and 200-Ω load. Slew rate is very high at 4900 V/μs and with settling time of 3.3 ns to 1% (2 V step) it is ideal for pulsed applications. It is designed for minimum gain of 0 dB.

To allow for dc coupling to ADCs, its unique output common-mode control circuit maintains the output common-mode voltage within 5-mV offset (typical) from the set voltage, when set within ±0.5 V of mid-supply. The common-mode set point is set to mid-supply by internal circuitry, which may be over-driven from an external source.

The THS4511 is a high-performance amplifier that has been optimized for use in 5-V single supply data acquisition systems. The output has been optimized for best performance with its common-mode voltages set to mid supply, and the input has been optimized for performance over a wide range of common-mode input voltages. High performance at a low power-supply voltage enables single-supply 5-V data-acquisition systems while minimizing component count.

The THS4511 is offered in a Quad 16-pin leadless QFN package (RGT), and is characterized for operation over the full industrial temperature range from –40°C to 85°C.

#### Video Buffer, Single-Ended to Differential

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

over operating free-air temperature range (unless otherwise noted)

			UNIT
V <sub>SS</sub>	Supply voltage	V <sub>S-</sub> to V <sub>S+</sub>	5.5 V
V <sub>I</sub>	Input voltage		±V <sub>S</sub>
V <sub>ID</sub>	Differential input voltage		4 V
I <sub>O</sub>	Output current		200 mA
Continuous power dissipation			See Dissipation Rating Table
T <sub>J</sub>	Maximum junction temperature <sup>(2)</sup>		150°C
T <sub>J</sub>	Maximum junction temperature, continuous operation, long term reliability <sup>(3)</sup>		125°C
T <sub>A</sub>	Operating free-air temperature range		-40°C to 85°C
T <sub>stg</sub>	Storage temperature range		-65°C to 150°C
ESD ratings	HBM		2000 V
	CDM		1500 V
	MM		100 V

- (1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.
- (2) The absolute maximum temperature under any condition is limited by the constraints of the silicon process.
- (3) The maximum junction temperature for continuous operation is limited by the package constraints. Operation above this temperature may result in reduced reliability and/or lifetime of the device. The THS4511 incorporates a (QFN) exposed thermal pad on the underside of the chip. This acts as a heatsink and must be connected to a thermally dissipative plane for proper power dissipation. Failure to do so may result in exceeding the maximum junction temperature which could permanently damage the device. See TI technical brief [SLMA002](#) and [SLMA004](#) for more information about utilizing the QFN thermally enhanced package.

### DISSIPATION RATINGS TABLE PER PACKAGE

PACKAGE <sup>(1)</sup>	θ <sub>JC</sub>	θ <sub>JA</sub>	POWER RATING	
			T <sub>A</sub> ≤ 25°C	T <sub>A</sub> = 85°C
RGT (16)	2.4°C/W	39.5°C/W	2.3 W	225 mW

- (1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI Web site at [www.ti.com](http://www.ti.com).

**TEST CIRCUITS**

The THS4511 is tested with the following test circuits built on the EVM. For simplicity, the power supply decoupling is not shown – see the layout in the application information section for recommendations. Depending on the test conditions, component values are changed per the following tables, or as otherwise noted. The signal generators used are ac coupled 50-Ω sources and a 0.22-μF capacitor and a 49.9-Ω resistor to ground are inserted across  $R_{IT}$  on the alternate input to balance the circuit.

**Table 1. Gain Component Values**

GAIN	$R_F$	$R_G$	$R_{IT}$
0 dB	348 Ω	340 Ω	56.2 Ω
6 dB	348 Ω	165 Ω	61.9 Ω

**Note the gain setting includes 50-Ω source impedance. Components are chosen to achieve gain and 50-Ω input termination.**

**Table 2. Load Component Values**

$R_L$	$R_O$	$R_{OT}$	Atten.
100 Ω	25 Ω	open	6 dB
200 Ω	86.6 Ω	69.8 Ω	16.8 dB
499 Ω	237 Ω	56.2 Ω	25.5 dB
1k Ω	487 Ω	52.3 Ω	31.8 dB

**Note the total load includes 50-Ω termination by the test equipment. Components are chosen to achieve load and 50-Ω line termination through a 1:1 transformer.**

Due to the voltage divider on the output formed by the load component values, the amplifier's output is attenuated. The column *Atten* in Table 2 shows the attenuation expected from the resistor divider. When using a transformer at the output as shown in Figure 39, the signal will see slightly more loss, and these numbers will be approximate.

**Frequency Response**

The circuit shown in Figure 38 is used to measure the frequency response of the circuit.

A network analyzer is used as the signal source and as the measurement device. The output impedance of the network analyzer is 50 Ω.  $R_{IT}$  and  $R_G$  are chosen to impedance match to 50 Ω, and to maintain the proper gain. To balance the amplifier, a 0.22-F capacitor and 49.9-Ω resistor to ground are inserted across  $R_{IT}$  on the alternate input.

The output is probed using a high-impedance differential probe across the 100-Ω resistor. The gain is referred to the amplifier output by adding back the 6-dB loss due to the voltage divider on the output.

**Figure 38. Frequency Response Test Circuit**

**Distortion and 1dB Compression**

The circuit shown in Figure 39 is used to measure harmonic distortion, intermodulation distortion, and 1-dB compression point of the amplifier.

A signal generator is used as the signal source and the output is measured with a spectrum analyzer. The output impedance of the signal generator is 50 Ω.  $R_{IT}$  and  $R_G$  are chosen to impedance-match to 50 Ω, and to maintain the proper gain. To balance the amplifier, a 0.22-F capacitor and 49.9-Ω resistor to ground are inserted across  $R_{IT}$  on the alternate input.

A low-pass filter is inserted in series with the input to reduce harmonics generated at the signal source. The level of the fundamental is measured, then a high-pass filter is inserted at the output to reduce the fundamental so that it does not generate distortion in the input of the spectrum analyzer.

The transformer used in the output to convert the signal from differential to single ended is an ADT1-1WT. It limits the frequency response of the circuit so that measurements cannot be made below approximately 1MHz.

**Figure 39. Distortion Test Circuit**

The 1-dB compression point is measured with a spectrum analyzer with 50-Ω double termination or 100-Ω termination as shown in Table 2. The input power is increased until the output is 1 dB lower than expected. The number reported in the table data is the power delivered to the spectrum analyzer input. Add 3 dB to refer to the amplifier output.

**S-Parameter, Slew Rate, Transient Response, Settling Time, Output Impedance, Overdrive, Output Voltage, and Turn-On/Off Time**

The circuit shown in Figure 40 is used to measure s-parameters, slew rate, transient response, settling time, output impedance, overdrive recovery, output voltage swing, and turn-on/turn-off times of the amplifier. For output impedance, the signal is injected at  $V_{OUT}$  with  $V_{IN}$  left open and the drop across the  $49.9\ \Omega$  resistor is used to calculate the impedance seen looking into the amplifier's output.

Because  $S_{21}$  is measured single-ended at the load with  $50\text{-}\Omega$  double termination, add 12 dB to refer to the amplifier's output as a differential signal.

Figure 40. S-Parameter, SR, Transient Response, Settling Time,  $Z_O$ , Overdrive Recovery,  $V_{OUT}$  Swing, and Turn-on/off Test Circuit

**CM Input**

The circuit shown in Figure 41 is used to measure the frequency response and input impedance of the CM input. Frequency response is measured single-ended

at  $V_{OUT+}$  or  $V_{OUT-}$  with the input injected at  $V_{IN}$ ,  $R_{CM} = 0\ \Omega$  and  $R_{CMT} = 49.9\ \Omega$ . The input impedance is measured with  $R_{CM} = 49.9\ \Omega$  with  $R_{CMT} = \text{open}$ , and calculated by measuring the voltage drop across  $R_{CM}$  to determine the input current.

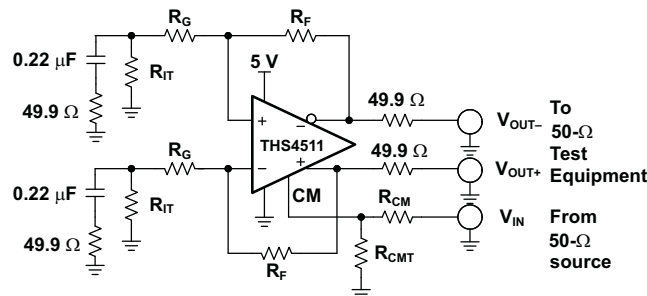

Figure 41. CM Input Test Circuit

**CMRR and PSRR**

The circuit shown in Figure 42 is used to measure the CMRR and PSRR of  $V_{S+}$  and  $V_{S-}$ . The input is switched appropriately to match the test being performed.

Figure 42. CMRR and PSRR Test Circuit

APPLICATION INFORMATION

APPLICATIONS

The following circuits show application information for the THS4511. For simplicity, power supply decoupling capacitors are not shown in these diagrams. For more detail on the use and operation of fully differential operational amplifiers refer to application report *Fully-Differential Amplifiers (SLOA054)*.

Differential Input to Differential Output Amplifier

The THS4511 is a fully differential operational amplifier, and can be used to amplify differential input signals to differential output signals. A basic block diagram of the circuit is shown in [Figure 43](#) (CM input not shown). The gain of the circuit is set by  $R_F$  divided by  $R_G$ .

Figure 43. Differential Input to Differential Output Amplifier

Depending on the source and load, input and output termination can be accomplished by adding  $R_{IT}$  and  $R_O$ .

Single-Ended Input to Differential Output Amplifier

The THS4511 can be used to amplify and convert single-ended input signals to differential output signals. A basic block diagram of the circuit is shown in [Figure 44](#) (CM input not shown). The gain of the circuit is again set by  $R_F$  divided by  $R_G$ .

Figure 44. Single-Ended Input to Differential Output Amplifier

Input Common-Mode Voltage Range

The input common-mode voltage of a fully differential operational amplifier is the voltage at the (+) and (-) input pins of the operational amplifier.

It is important to not violate the input common-mode voltage range ( $V_{ICR}$ ) of the operational amplifier. Assuming the operational amplifier is in linear operation the voltage across the input pins is only a few millivolts at most. So finding the voltage at one input pin determines the input common-mode voltage of the operational amplifier.

Treating the negative input as a summing node, the voltage is given by [Equation 1](#):

$$V_{IC} = \left( V_{OUT+} \times \frac{R_G}{R_G + R_F} \right) + \left( V_{IN-} \times \frac{R_F}{R_G + R_F} \right) \tag{1}$$

To determine the  $V_{ICR}$  of the operational amplifier, the voltage at the negative input is evaluated at the extremes of  $V_{OUT+}$ .

As the gain of the operational amplifier increases, the input common-mode voltage becomes closer and closer to the input common-mode voltage of the source.

### Setting the Output Common-Mode Voltage

The output common-mode voltage is set by the voltage at the CM pin(s). The internal common-mode control circuit maintains the output common-mode voltage within 5-mV offset (typical) from the set voltage, when set within 0.5 V of mid-supply. If left unconnected, the common-mode set point is set to mid-supply by internal circuitry, which may be over-driven from an external source. Figure 45 is representative of the CM input. The internal CM circuit has about 700 MHz of -3-dB bandwidth, which is required for best performance, but it is intended to be a dc-bias input pin. Bypass capacitors are recommended on this pin to reduce noise at the output. The external current required to overdrive the internal resistor divider is given by Equation 2:

$$I_{EXT} = \frac{2V_{CM} - (V_{S+} - V_{S-})}{50 \text{ k}\Omega} \quad (2)$$

where  $V_{CM}$  is the voltage applied to the CM pin, and  $V_{S+}$  ranges from 3.75 V to 5 V, and  $V_{S-}$  is 0 V (ground).

Figure 45. CM Input Circuit

### Device Operation with Single Power Supplies Less than 5 V

The THS4511 is optimized to work in systems using 5-V single supplies, and the characterization data presented in this data sheet was taken with 5-V single-supply inputs. For ac-coupled systems or dc-coupled systems operating with supplies less than 5 V and greater than 3.75 V, the amplifier input common-mode range is maximized by adding pull-down resistors at the device inputs. The pull-down resistors provide additional loading at the input, and lower the common-mode voltage that is fed back into the device input through resistor  $R_F$ . Figure 46 shows the circuit configuration for this mode of operation where  $R_{PD}$  is added to the dc-coupled circuit to avoid violating the  $V_{ICR}$  of the

operational amplifier. Note  $R_S$  and  $R_{IT}$  are added to the alternate input from the signal input to balance the amplifier. One resistor that is equal to the combined value  $R_I = R_G + R_S || R_{IT}$  can be placed at the alternate input.

Figure 46. THS4511 DC Coupled Single-Source Supply Range From 3.75 V to 5 V With  $R_{PD}$  Used To Set  $V_{IC}$

Note that in Figure 46, the source is referenced to ground as is the input termination resistor  $R_{IT}$ . The proper value of resistance to add can be calculated from Equation 3:

$$R_{PD} = \frac{1}{\frac{1}{R_F} \left[ \frac{1.6}{\frac{V_{S+}}{2} - 1.6} \right] - \frac{1}{R_I}} \quad (3)$$

where  $R_I = R_G + R_S || R_{IT}$ .

$V_{S+}$  is the power-supply voltage,  $R_F$  is the feedback resistance,  $R_G$  is the gain-setting resistance,  $R_S$  is the signal source resistance, and  $R_{IT}$  is the termination resistance.

Table 3 is a modification of Table 1 to add the proper values with  $R_{PD}$  assuming  $V_{S+} = 3.75$  V, a dc-coupled 50-Ω source impedance, and setting the output common-mode voltage to mid-supply.

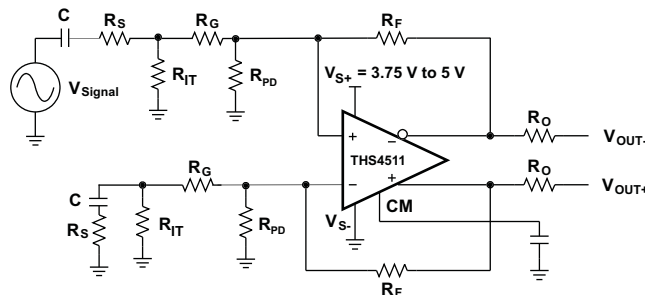

Table 3.  $R_{PD}$  Values for Various Gains,  $V_{S+} = 3.75$  V, DC-coupled Signal Source

Gain	$R_F$	$R_G$	$R_{IT}$	$R_{PD}$
0 dB	348 Ω	340 Ω	56.2 Ω	422 Ω
6 dB	348 Ω	169 Ω	64.9 Ω	86.6 Ω

If the signal originates from an ac-coupled 50-Ω source (see Figure 47), the equivalent dc-source resistance is an open circuit and  $R_I = R_G + R_{IT}$ . Table 4 is a modification of Table 1 to add the proper values with  $R_{PD}$  assuming  $V_{S+} = 3.75$  V, an ac-coupled 50-Ω source impedance, and setting the output common-mode voltage to mid-supply.

**Table 4.  $R_{PD}$  Values for Various Gains,  $V_{S+} = 3.75$  V, AC-coupled Signal Source**

Gain	$R_F$	$R_G$	$R_{IT}$	$R_{PD}$
0 dB	348 $\Omega$	340 $\Omega$	56.2 $\Omega$	390 $\Omega$
6 dB	348 $\Omega$	169 $\Omega$	64.9 $\Omega$	80.6 $\Omega$

**Figure 47. THS4511 AC Coupled Single-Source Supply Range From 3.75 V to 5 V With  $R_{PD}$  Used To Set  $V_{IC}$**

**Video Buffer**

Figure 48 shows a possible application of the THS4508 as a DC-coupled video buffer with a gain of 2. Figure 49 shows a plot of the Y' signal originating from a HDTV 720p video system. The input signal includes a tri-level sync (minimum level at  $-0.3$  V) and the portion of a video signal with maximum amplitude of  $0.7$  V. Although the buffer draws its power from a 5V single-ended power supply, internal level shifters allow the buffer to support input signals which are as much as  $-0.3$  V below ground. This allows maximum design flexibility while maintaining a minimum parts count. Figure 50 shows the differential output of the buffer. Note that the DC-coupled amplifier can introduce a DC offset on a signal applied at its input.

**Figure 48. Single-Supply Video Buffer, Gain = 2**

**Figure 49. Y' Signal with 3-Level Sync and Video Signal**

**Figure 50. Video Buffer Differential Output Signal**

### THS4511 + ADS5500 Combined Performance

The THS4511 is designed to be a high performance drive amplifier for high performance data converters like the ADS5500 14-bit 125-MSPS ADC. Figure 51 shows a circuit combining the two devices. The THS4511 amplifier circuit provides 0 dB of gain, and converts the single-ended input signal to a differential output signal. The default common-mode output of the THS4511 (2.5 V) is not compatible with the required common-mode input of the ADS5500 (1.55 V), so dc-blocking capacitors are added (0.22  $\mu$ F). Note that a biasing circuit (not shown in Figure 51) is needed to provide the required common-mode, dc-input for the ADS5500. The 100- $\Omega$  resistors and 2.7-pF capacitor between the THS4511 outputs and ADS5500 inputs along with the input capacitance of the ADC limit the bandwidth of the signal to 115 MHz (-3 dB). For testing, a signal generator is used for the signal source. The generator is an ac-coupled 50- $\Omega$  source. A band-pass filter is inserted in series with the input to reduce harmonics and noise from the signal source. Input termination is accomplished via the 69.8- $\Omega$  resistor and 0.22- $\mu$ F capacitor to ground in conjunction with the input impedance of the amplifier circuit. A 0.22- $\mu$ F capacitor and 49.9- $\Omega$  resistor is inserted to ground across the 69.8- $\Omega$  resistor and 0.22- $\mu$ F capacitor on the alternate input to balance the circuit. Gain is a function of the source impedance, termination, and 348- $\Omega$  feedback resistor. See Table 1 for component values to set proper 50- $\Omega$  termination for other common gains.

Figure 51. THS4511 + ADS5500 Circuit

### THS4511 + ADS5424 Combined Performance

Figure 52 shows the THS4511 driving the ADS5424 ADC.

As before, the THS4511 amplifier provides 0 dB of gain, converts the single-ended input to differential, and sets the proper input common-mode voltage to the ADS5424. Input termination and circuit testing is the same as described above for the THS4511 + ADS5500 circuit.

The 225- $\Omega$  resistors and 2.7-pF capacitor between the THS4511 outputs and ADS5424 inputs (along with the input capacitance of the ADC) limit the bandwidth of the signal to about 100MHz (-3dB).

When the THS4511 is operated from a single power supply with  $V_{S+} = 5$  V and  $V_{S-} =$  ground, the 2.5-V output common-mode voltage is compatible with the recommended value of the ADS5424 input common-mode voltage (2.4 V).

Figure 52. THS4511 + ADS5424 Circuit

## Layout Recommendations

It is recommended to follow the layout of the external components near the amplifier, ground plane construction, and power routing of the EVM as closely as possible. General guidelines are:

1. Signal routing should be direct and as short as possible into and out of the operational amplifier circuit.
2. The feedback path should be short and direct avoiding vias.
3. Ground or power planes should be removed from directly under the amplifier's input and output pins.
4. An output resistor is recommended on each output, as near to the output pin as possible.
5. Two 10-F and two 0.1-F power-supply decoupling capacitors should be placed as near to the power-supply pins as possible.
6. Two 0.1-F capacitors should be placed between the CM input pins and ground. This limits noise coupled into the pins. One each should be placed to ground near pin 4 and pin 9.
7. It is recommended to split the ground plane on layer 2 (L2) as shown below and to use a solid ground on layer 3 (L3). A single-point connection should be used between each split section on L2

and L3.

8. A single-point connection to ground on L2 is recommended for the input termination resistors R1 and R2. This should be applied to the input gain resistors if termination is not used.
9. The THS4511 recommended PCB footprint is shown in [Figure 53](#).

**Figure 53. QFN Etch and Via Pattern**

THS4511 EVM

Figure 54 is the THS4511 EVAL1 EVM schematic, layers 1 through 4 of the PCB are shown in Figure 55, and Table 5 is the bill of material for the EVM as supplied from TI.

## EVM WARNINGS AND RESTRICTIONS

It is important to operate this EVM within the input and output voltage ranges as specified in the table provided below.

Input Range, $V_{S+}$ to $V_{S-}$	3.0 V to 6.0 V
Input Range, $V_I$	3.0 V to 6.0 V NOT TO EXCEED $V_{S+}$ or $V_{S-}$
Output Range, $V_O$	3.0 V to 6.0 V NOT TO EXCEED $V_{S+}$ or $V_{S-}$

Exceeding the specified input range may cause unexpected operation and/or irreversible damage to the EVM. If there are questions concerning the input range, please contact a TI field representative prior to connecting the input power.

Applying loads outside of the specified output range may result in unintended operation and/or possible permanent damage to the EVM. Please consult the product data sheet or EVM user's guide (if user's guide is available) prior to connecting any load to the EVM output. If there is uncertainty as to the load specification, please contact a TI field representative.

During normal operation, some circuit components may have case temperatures greater than 30°C. The EVM is designed to operate properly with certain components above 50°C as long as the input and output ranges are maintained. These components include but are not limited to linear regulators, switching transistors, pass transistors, and current sense resistors. These types of devices can be identified using the EVM schematic located in the material provided. When placing measurement probes near these devices during operation, please be aware that these devices may be very warm to the touch.

THS4511RGTTG4	ACTIVE	QFN	RGT	16	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

PLASTIC QUAD FLATPACK

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Quad Flatpack, No-leads (QFN) package configuration.
  -  D. The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
  - E. Falls within JEDEC MO-220.

**THERMAL INFORMATION**

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, Quad Flatpack No-Lead Logic Packages, Texas Instruments Literature No. SCBA017. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Publication IPC-7351 is recommended for alternate designs.
  - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SCBA017, SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
