

LM3508 Evaluation Board

National Semiconductor
Application Note 1593
Travis Eichhorn
June 2007

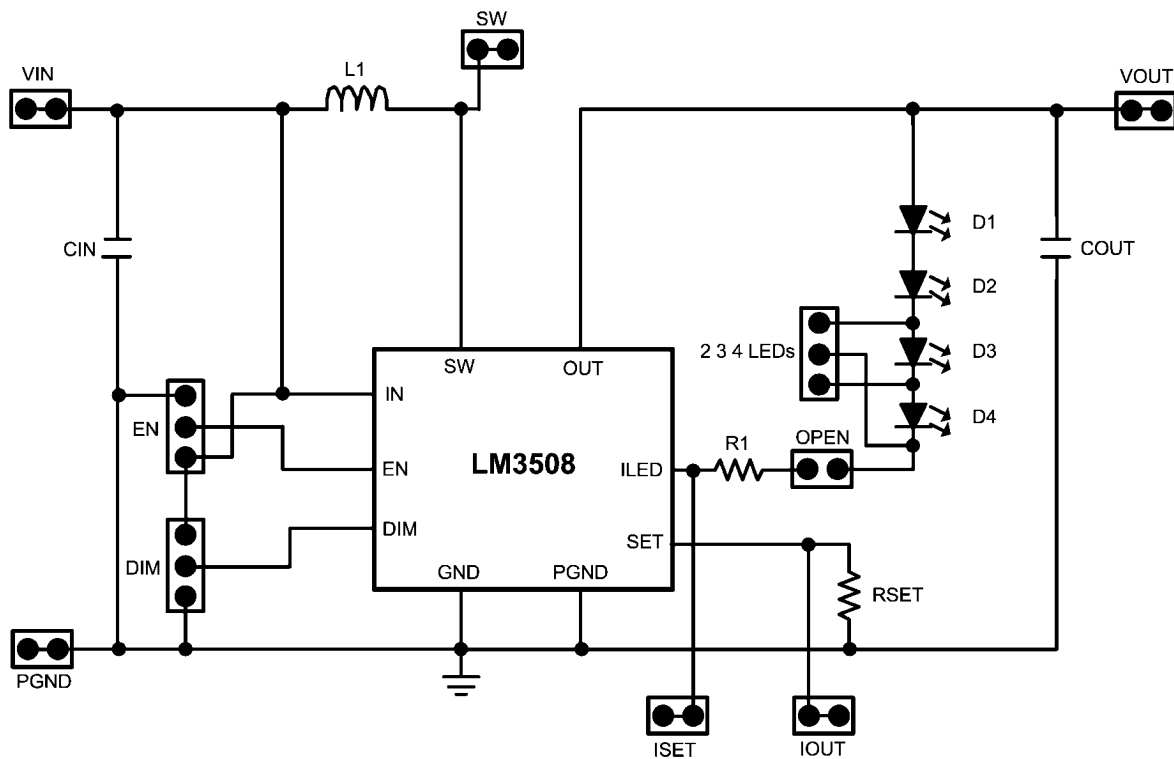

Introduction

The LM3508 is a synchronous step-up DC/DC converter designed for white LED applications. The evaluation board is set up to drive 4 standard V_F white LEDs from a 2.7V to 5.5V input supply. A fifth LED can be placed across the R1 pad for testing

up to 5 low VF LEDs. The LED current is set using the RSET resistor via the equation $I_{LED} = 0.2V/RSET$. The evaluation board comes with RSET = 10Ω for approximately 20 mA LED current. LED dimming is achieved by applying a PWM waveform of up to 100kHz to the DIM pin.

Board Operation

To operate the LM3508 evaluation board, connect a 2.7V to 5.5V supply between the VIN header and PGND.

Jumper Connections

- EN is a 3-position jumper (see bottom right jumper in figure 2). The middle pin connects to EN of the device. The top pin of the EN header connects to PGND (device disabled) and the bottom pin connects to VIN (device enabled).
- DIM is a 3-position header (see figure 2). The middle pin connects to DIM of the LM3508. The left pin of the DIM header connects to PGND (current source off). The right pin connects to VIN (current source on with max LED current of 20mA). Drive DIM with a PWM waveform ($V_H > 1.1V$, $V_L < 0.5V$) at up to 100kHz to adjust the LED brightness.
- 2 3 4 LEDs is a 3-position header (see figure 2). Leave open to configure the board for 4 series LEDs. Place a jumper

across the top and middle pin to short D3 and D4 (2 LED solution). Place a jumper across the bottom and middle pin to short only D4 (3 LED solution).

- The OPEN header opens the current path from the cathode of D4 and the input to the current source. Normally this is shorted. This is for demonstrating OVP and/or disconnecting the LEDs.

R1 is a short (0Ω) this can be replaced with a sense resistor for measuring the LED current or replaced with a 5th LED for evaluation of low VF LEDs. EN has an internal $383k\Omega$ pull-down resistor placing the part in shutdown by default. DIM also has an internal $383k\Omega$ pull-down resistor turning off the current source by default. For more information regarding the operation of the LM3508 please refer to the LM3508 datasheet.

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE CHIEF EXECUTIVE OFFICER AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.
