## **1 GENERAL INTRODUCTION**

### **1.1 Introduction**

This first chapter contains general information that will be useful to know before using the XE8000EV110

### **1.2 Highlights**

The information you will gain from this chapter:

- About this Guide
- Recommended Reading
- Troubleshooting
- The Semtech Web Site
- Customer Support

### **1.3 About this Guide**

This document describes how to use The XE8000EV110 as an evaluation board to develop and debug programs on the XE8802 microcontroller in TQFP100 package.

The manual Layout is as follows:

- Chapter 2 : Overview and Installation
- Chapter 3 : Electrical specifications and hardware description
- Chapter 4 : Troubleshooting
- Chapter 5 : Schematics

### **1.4 Documentation Updates**

All documentation evolves and this User's Guide is no exception. Since XE8000EV110 and other SEMTECH tools are constantly evolving to meet customer needs, some tool descriptions may differ from those in this document. Please refer to our web site at <http://www.semtech.com> to obtain the latest documentation available.

### **1.5 Recommended Reading**

This user's guide describes how to use The XE8000EV110. Other useful documents are listed below:

- Datasheet XE8802.
- ProStart II (XE8000MP) user guide
- SEMTECH Application notes (AN8000.xx).

These can be found on our web site <http://www.semtech.com>

### **1.6 Troubleshooting**

See Chapter 4 for information on common problems.

### **1.7 The Semtech Web Site**

Semtech provides on line support on the Semtech World Wide Web site. The web site is used by Semtech as a means to make files and information easily available to customers. It is at <http://www.semtech.com>

### **1.8 Customer Support**

Customers should call their distributor, representative or field application engineer for support. Users of Semtech products can receive assistance through several channels:

- Distributors or Representative, Local Sales Office
- Field Application Engineer (FAE)
- Third party for source code

## **2 OVERVIEW AND INSTALLATION**

### **2.1 Introduction**

This chapter gives you an overview of the XE8000EV110 evaluation board and then explains how to install the system hardware.

### **2.2 Highlights**

The items discussed in this chapter include:

- What is XE8000EV110
- XE8000EV110 components
- How XE8000EV110 helps you
- Installing XE8000EV110 hardware

### **2.3 What is the XE8000EV110**

The XE8000EV110 is the evaluation board for XE8802 microcontroller packaged in the TQFP100. This board is designed to be interfaced with the XE8000MP board also. Note that the combination of a XE8000MP and any XE8000EVXXX constitutes the ProStart II system. The XE8000EV110 allows the user to access to every pin of the chip, and provides external actuators and indicators such as LEDs and buttons.

### **2.4 XE8000EV110 components**

The XE8000EV110 is delivered separately, with 3 XE8802 samples. However you need to have the XE8000MP to program these samples. Since one XE8000MP is compatible with the whole XE8000 family, this allows you to have multiple XE8000EVXXX without having to buy another XE8000MP.

XE8000EV110 packages contents:

1 XE8000EV110

1 Box

3 Samples

### **2.5 How the XE8000EV110 helps you**

XE8000EV110 allows you to:

- Create an action on an input port with buttons (note that jumpers can disable this feature).
- Reset the circuit.
- See an action on an output port with LED (note that jumpers can disable this feature).
- Store data in an on board SPI EEPROM.
- Interface a RS232 line driver (with the help of the XE8000MP) to the UART peripheral.
- Use an on board 32kHz watch Xtal, or an external clock source.
- Measure the current consumption of the circuit.
- Power the board with three different sources :
  - An external power supply.
  - A button type battery.
  - The ProStart II board.
- Create a quick hardware application on an on-board engineering zone.

## 2.6 Installing XE8000EV110 hardware

### 2.6.1 Placing the chip on the ZIF socket

The XE8802 must be placed with the pin 1 marker aligned with the pin 1 marker of the board. See picture below:

**Figure 1** Position of the chip in the ZIF socket

### 2.6.2 Using an external power supply

To use an external power supply, the user must connect the pins labelled “+” and “-” (see Figure 2) on the header named “EXT POWER” near the battery carrier with regulated 1.2 to 5.5 Volts power supply. The switch must be in the “on” position.

**Warning this power source is not protected by a fuse!** The user can prevent destroying the board/chip by limiting the current of the power supply source.

### 2.6.3 Using a button type battery

To power the application with a battery, you may place a button battery of the type cr1620 on the carrier (+ on the top, diameter 16mm height 2.0mm). Since the carrier is flexible, the height can vary a little bit.

**Warning this power source is not protected by a fuse!**

### 2.6.4 Using the ProStart II as power supply and programmer

Please refer to ProStart II user guide to use the XE8000EV110 with the ProStart II as a power supply or a programmer.  
**Note :** When the ProStart II (XE8000MP) is connected, all the other supply sources are bypassed, the default supply of the ProStart II (XE8000MP) is 3.0 Volts and the programming voltage is 5.0 Volts.

### 2.6.5 Using an external clock source

To use an external clock source, the user must disconnect the on onboard xtal by removing the br1 jumper, and place it's own source on the pin XIN on the header. (see Figure 3)

### 2.6.6 Measuring the circuit consumption

To measure the consumption of the XE8802, the user must remove the jumper named br\_consumption and place an amperemeter between these two points.

### 2.6.7 How to use the on-board EEPROM

To use the on board EEPROM, place the jumpers br4 to br7, and for the software please check on our web site for the technical note TN8000.14 on <http://www.semtech.com>

### 3 ELECTRICAL SPECIFICATIONS AND HARDWARE DESCRIPTION

#### 3.1 Introduction

This chapter gives you a view of the main characteristics of the XE8000EV110 hardware.

#### 3.2 Hardware layout

**Figure 2 Board elements**

**Figure 3 Detailed view of the header**

### 3.6 LCD specifications

The LCD provided has the following specifications:

**Device name** : VIM828  
**Multiplex** : 4x  
**Digits** : 8  
**Digit height** : 8.9mm  
**Segments/digits** : 14  
**Supplier** : <http://www.varitronix.com/>

### 3.7 LCD display mechanical specifications

VIM-828-DP, VIM-828-2

Figure 7 LCD display mechanical data

### 3.8 Segments mapping

Figure 8 Segments naming convention

	LC02 registers	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
Digit 1	RegLcdData0	1d	1e	1f		1dp	1c	1b	1a

## 4 TROUBLESHOOTING

### 4.1 Introduction

This section is intended to help the XE8000EV110 users to perform basic hardware debugging.

### 4.2 Highlights

This chapter contains the following points:

- XE8000EV110 functionality
- XE8000EV110 hardware

### 4.3 XE8000EV110 functionality

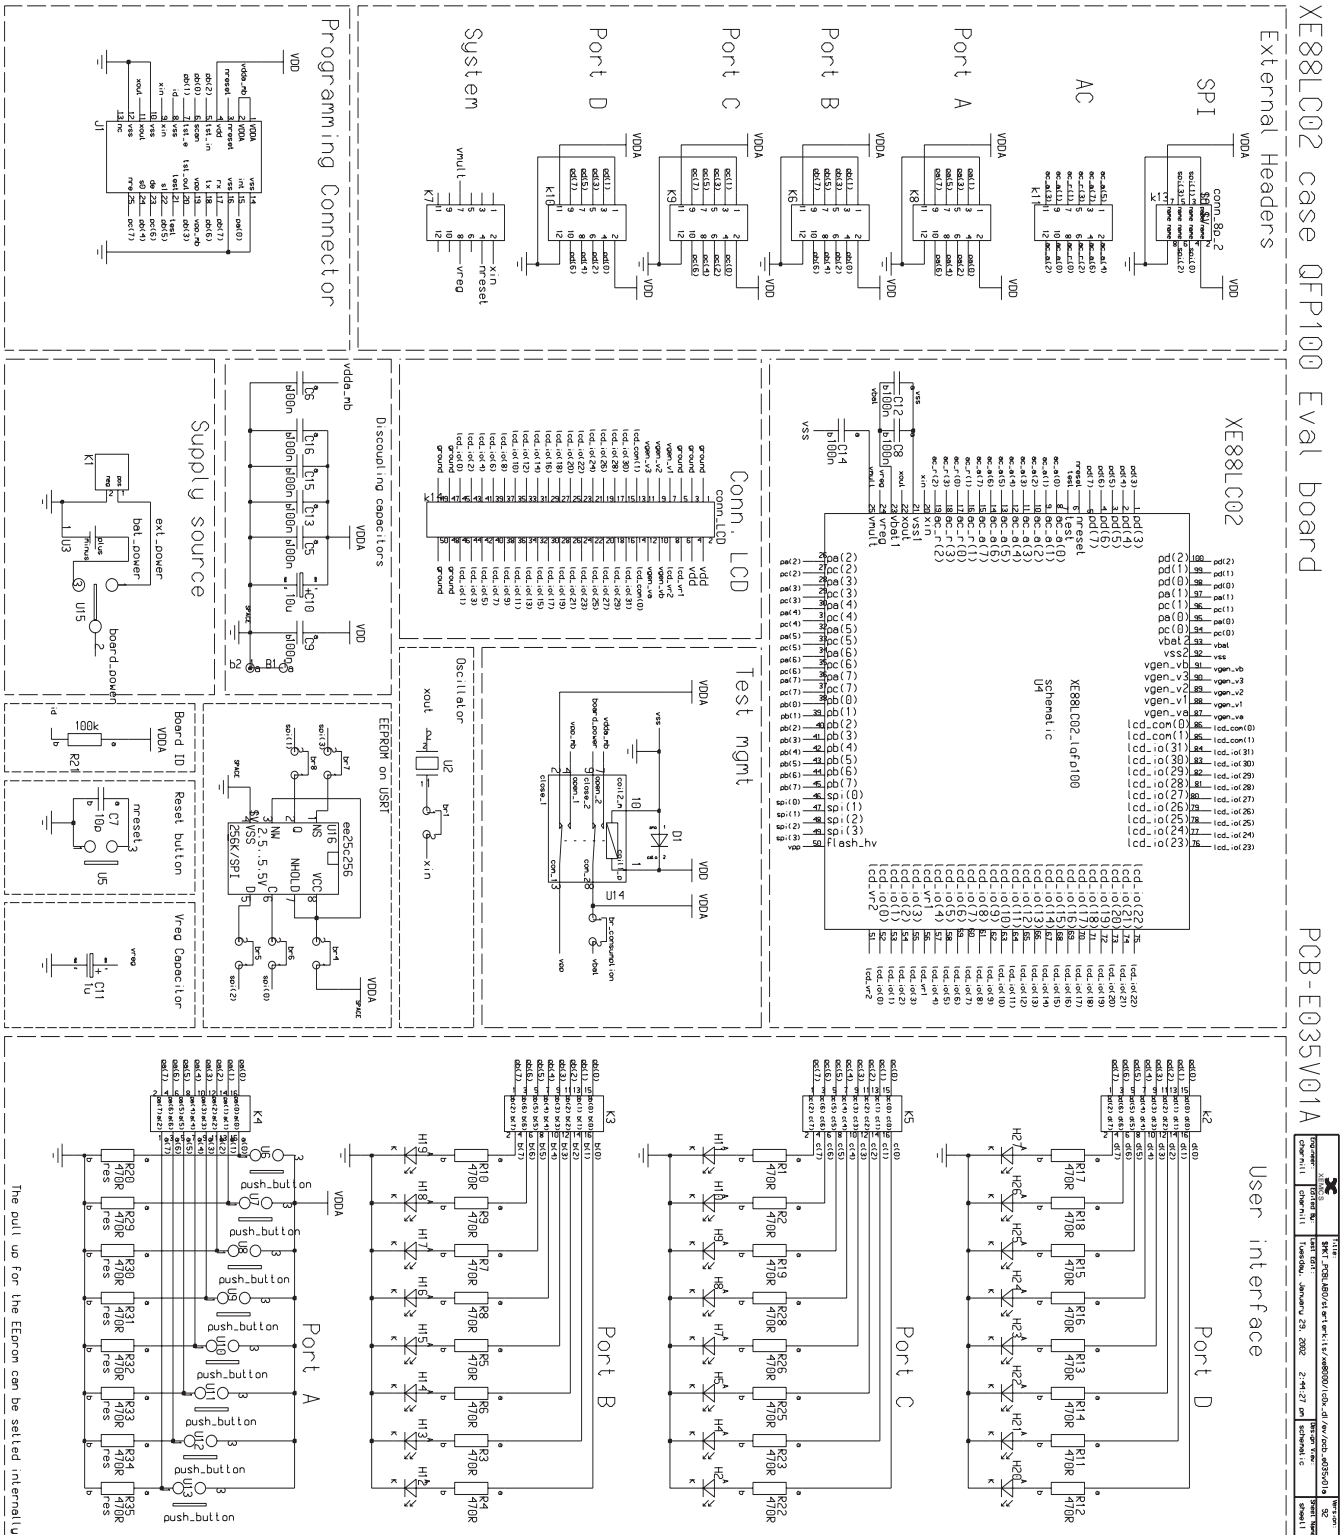

<b>The software that should use the Xtal peripheral seems to be locked.</b>	
Possible causes :	<ol style="list-style-type: none"> <li>1 The jumper br1 is removed</li> <li>2 You disturb the xin and xout lines with an oscilloscope probe.</li> <li>3 The Xtal is not correctly soldered on the board.</li> <li>4 The Xtal is damaged.</li> </ol>
<b>The programme that should use the EEPROM interface or another SPI device is unable to communicate.</b>	
Possible cause :	<ol style="list-style-type: none"> <li>1 The LED jumpers of the ports used are connected</li> <li>2 The EEPROM jumpers (br5&amp;6)are removed</li> <li>3 The EEPROM power jumpers is removed</li> </ol>
When using the ProStart II (XE8000MP) as power supply, the VDDA seems to be unstable.	
Possible causes :	<ol style="list-style-type: none"> <li>1 The PortB 7 is not used as UART RX and the RS232 line driver creates an output conflict, simply remove the RS232 cable from the ProStart II (XE8000MP) and the RS232 output will go to High Z.</li> <li>2 The power consumption of your application is above 500mA</li> </ol>

### 4.4 XE8000EV110 hardware

<b>The board presents a short circuit between VDDA and GND.</b>	
Possible causes :	<ol style="list-style-type: none"> <li>1 The battery carrier has been damaged and the + contact touches the - : just put a piece of paper between the two contacts</li> <li>2 If you are measuring a signal on the board, be careful to not use the ground connection on the headers : There is a more accessible ground near the PA7 button.</li> </ol>
<b>The power supply of the battery is not present on the VDDA line.</b>	
Possible causes :	<ol style="list-style-type: none"> <li>1 The power switch is in the wrong position, to use the battery the switch must be off.</li> <li>2 The board is connected to a XE8000MP, in this case user power supplies are bypassed.</li> </ol>
<b>The LCD display doesn't display all the digits</b>	
Possible causes :	<ol style="list-style-type: none"> <li>1 The connector is weak, try to move the board a little bit.</li> </ol>
