General Description

Applications

The MAX9987 and MAX9988 LO buffers/splitters each

integrate a passive two-way power splitter with high-

isolation input and output buffer amplifiers. These buffers are designed to provide the high output

(+14dBm to +20dBm) necessary to drive the LO inputs

of high-linearity passive mixers, while offering 40dB reverse isolation to prevent LO pulling. The MAX9987 is

internally matched for the cellular/GSM bands, and the

+17dBm output power with ±1dB variation over supply,

temperature, and input power. With two optional resistors, the output power can be precision set from +14dBm to +20dBm. The devices offer more than 30dB output-to-output port isolation, and are offered in 5mm × 5mm 20-pin thin QFN packages with exposed paddle.

Point-to-Point Systems

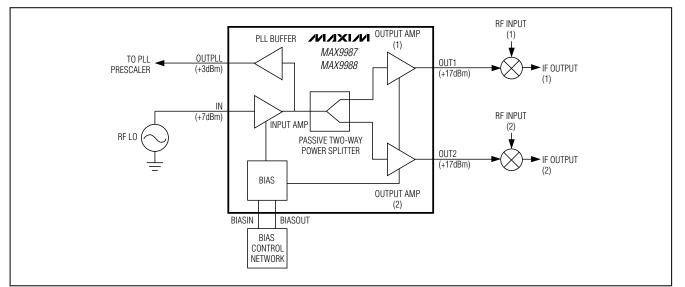

MAX9988 is matched for the DCS/PCS/UMTS bands. The typical application circuit provides a nominal Features

- ±1dB Output Power Variation
- +14dBm to +20dBm Adjustable Output Power
- Two-Way Power Splitting
- ♦ 40dB Reverse Isolation
- More than 30dB Output-to-Output Isolation
- Low Output Noise: -170dBc/Hz at +17dBm
- 160mA Supply Current at +17dBm
- Isolated PLL Output (+3dBm)

Pin Description

PIN	NAME	FUNCTION	
1, 4, 8, 9, 13, 17, 18, EP	GND	Ground	
2	IN	Input. Internally matched 50 Ω RF input. AC couple to this pin.	
3	VCCREF	Supply. Supply connection for on-chip voltage and current references. See <i>Applications Information</i> for information on decoupling.	
5	REF	Voltage Reference Output. Output for on-chip 1.5V bandgap voltage reference. See <i>Applications Information</i> section for information on decoupling.	
6	BIASIN	Bias Connection for Input Buffer. Set compressed power point for input amplifier with a resistor to REF or GND. For +17dBm output power, no external biasing resistors are required. See <i>Applications Information</i> section for information.	
7	BIASOUT	Bias Connection for Output Amplifiers. Set compressed power point for OUT1 and OUT2 with a resistor to REF or ground. For +17dBm output power, no external biasing resistors are required. See <i>Applications Information</i> section for information.	
10	OUT2	Output 2. Internally matched 50 Ω RF output. AC couple to this pin.	
11, 12	VCC3	Supply. Supply connection for OUT2.	
14, 15	VCC2	Supply. Supply connection for OUT1.	
16	OUT1	Output 1. Internally matched 50 Ω RF output. AC couple to this pin.	
19	VCC1	Supply. Supply connection for input amplifier.	
20	OUTPLL	Output PLL. Output for driving optional external PLL.	

Detailed Description

The MAX9987/MAX9988 LO amplifiers/splitters each consist of a single input amplifier, a two-way passive power splitter, two separate output amplifiers, as well as a third buffer amplifier to drive the LO's PLL. The bias currents for the amplifiers are adjustable through off-chip resistors. This allows the output level to be precision set anywhere from +14dBm to +20dBm. The PLL output is preset to +3dBm (about 900mV_{P-P} into 50 Ω).

Power levels are typically ±1dB over the full supply, input power, frequency, and temperature range. Precision power control is achieved by internal control circuitry. Maintaining tight power control keeps the system engineer from over specifying the LO drive in order to guarantee a linearity specification in the base-station mixer.

More than 40dB isolation between the LO outputs and the input prevents VCO pulling, and the 30dB output-to-output isolation reduces branch-to-branch coupling.

The MAX9987 is specified from 700MHz to 1100MHz, and the MAX9988 is specified from 1500MHz to 2200MHz. Both are offered in compact 5mm × 5mm 20-pin QFN packages with exposed paddle.

Input Amplifier A single low-noise input amplifier before the passive splitter provides gain and isolation. The compressed output power for this stage is controlled by the bias setting resistors R₁ or R₄ (see *Typical Application Circuit*). These resistors are not required for the nominal +17dBm output; see Table 1 for bias resistor values to obtain +14dBm to +20dBm output power.

The input is internally matched to 50Ω , and typical VSWR is no more than 2:1 over all operating conditions. Since the input is internally biased, provide a DC block at the input pin.

PLL Amplifier and Output

A small amount of power is tapped off from the input amplifier's output, and fed to a high-isolation buffer to drive the PLL output at +3dBm. If the PLL output is not required, it can be disabled by removing R₃; disabling the PLL output saves 12mA supply current.

Passive Two-Way Splitter

The input amplifier drives an integrated power splitter. All impedance matching between stages is on-chip, so no external tuning components are required.

NOMINAL OUTPUT POWER (dBm)	R ₁ (Ω)	R ₂ (Ω)	R4 (Ω)	R ₅ (Ω)	MAX9987 INPUT DRIVE (dBm)	MAX9988 INPUT DRIVE (dBm)

R1, R2, R4, R5	See Table 1	See Table 1			
R3	100Ω	100Ω			

Driver Amplifiers and Outputs

Each of the output amplifiers are similar to the input amplifier, except they are biased higher to provide more output power. For example, with an input power of +10dBm, the MAX9987 can deliver +20dBm at both outputs. The bias is adjustable; see Table 1 for details.

Both RF outputs are internally matched to 50Ω , with a typical VSWR limit of 2:1. Provide DC blocking capacitors at the outputs.

Applications Information

Input and Output Matching

All input and output matching is accomplished on-chip; no external matching circuitry is required. Use a DC block of about 47pF (lowband) or 22pF (highband) at the input and the outputs. Because these parts are internally broadband matched, adjusting external component values can optimize performance for a particular band.

Input Drive Level

In the case of the MAX9987, the typical required input drive level is +7dBm for +17dBm output, or +10dBm for +20dBm output. The MAX9988 uses slightly higher input levels (see Table 1). The typical VCO cannot provide sufficient drive by itself; the typical application follows the VCO with attenuation (about +3dB), and then with a low-noise gain block. This allows the VCO to drive the MAX9987/MAX9988 input at the required level without being load-pulled.

Output Drive Level

The output drive of the MAX9987/MAX9988 is nominally +17dBm ± 1 dB. This is the typical application, with no external bias-setting resistors at INBIAS and OUTBIAS. Output power can be set from +14dBm to +20dBm by using the bias-setting resistor values listed in Table 1.

Layout Considerations

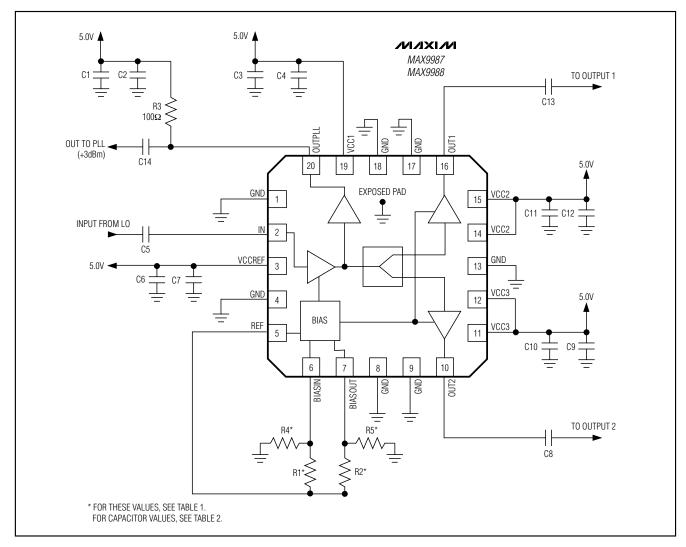

A properly designed PC board is an essential part of any RF/microwave circuit. Keep RF signal lines as short as possible to reduce losses, radiation, and inductance. For best performance, route the ground pin traces directly to the exposed pad underneath the package. This pad must be connected to the ground plane of the board by using multiple vias under the device to provide the best RF/thermal conduction path. Solder the exposed pad on the bottom of the device package to a PC board exposed pad.
