## Dual Band WCDMA Power Edge™ Power Amplifier Module 1850 to 1910 MHz and 1920 to 1980 MHz

### Features

- Single positive-supply operation and low power and shut-down modes
- 42% WCDMA efficiency at +28 dBm average output power 1920–1980 MHz
- 39% WCDMA efficiency at 27.5 dBm average output power 1850–1910 MHz
- Meets UMTS/WCDMA performance requirements in both UMTS bands
- Meets HSDPA performance requirements
- Compact Lead-free compliant LCC package—(3.0 x 3.0 x 1.0 mm nominal)
- Internally matched to 50 Ohms and DC blocked RF input/output

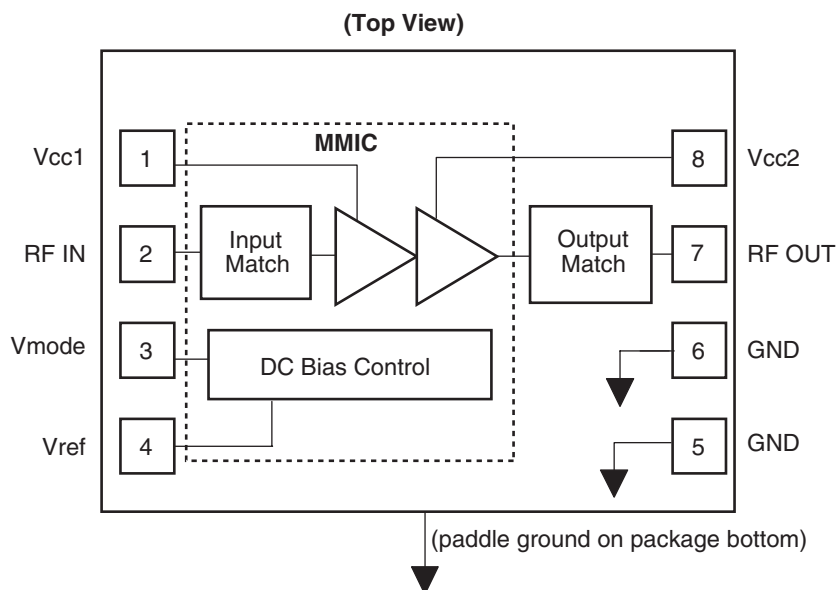

### General Description

The RMPA2265 power amplifier module (PAM) is designed for WCDMA/HSDPA applications in both the 1850–1910 and 1920–1980 MHz bands. The 2 stage PAM is internally matched to 50 Ohms to minimize the use of external components and features a low-power mode to reduce standby current and DC power consumption during peak phone usage. High power-added efficiency and excellent linearity are achieved using Fairchild's InGaP/GaAs Heterojunction Bipolar Transistor (HBT) process.

## Efficiency Improvement Applications

In addition to high-power/low-power bias modes, the efficiency of the PA module can be significantly increased at backed-off RF power levels by dynamically varying the supply voltage (Vcc) applied to the amplifier. Since mobile handsets and power amplifiers frequently operate at 10–20 dB back-off, or more, from maximum rated linear power, battery life is highly dependent on the DC power consumed at antenna power levels in the range of 0 to +16dBm. The reduced demand on transmitted RF power allows the PA supply voltage to be reduced for improved efficiency, while still meeting linearity requirements for WCDMA modulation with excellent margin. High-efficiency DC-DC converters are now available to implement switched-voltage operation.

With the PA module in low-power mode (Vmode = 2.0V) at +16dBm output power and supply voltages reduced from 3.4V nominal down to 1.2V, power-added efficiency is more than doubled from 9 percent to 25 percent (Vcc = 1.2V) while maintaining a typical ACLR1 of -40dBc and ACLR2 of less than -54 dBc. Operation at even lower levels of Vcc supply voltage are possible with a further restriction on the maximum RF output power.

## DC Turn On Sequence:

1. Vcc1 = Vcc2 = 3.4V (typical)
2. Vref = 2.85V (typical)
3. High-Power: Vmode = 0V (Pout > 16dBm)  
 Low-Power: Vmode = 2.0V (Pout < 16dBm)

## Applications Information

### CAUTION: THIS IS AN ESD SENSITIVE DEVICE.

#### Precautions to Avoid Permanent Device Damage:

- **Cleanliness:** Observe proper handling procedures to ensure clean devices and PCBs. Devices should remain in their original packaging until component placement to ensure no contamination or damage to RF, DC and ground contact areas.
- **Device Cleaning:** Standard board cleaning techniques should not present device problems provided that the boards are properly dried to remove solvents or water residues.
- **Static Sensitivity:** Follow ESD precautions to protect against ESD damage:
  - A properly grounded static-dissipative surface on which to place devices.
  - Static-dissipative floor or mat.
  - A properly grounded conductive wrist strap for each person to wear while handling devices.
- **General Handling:** Handle the package on the top with a vacuum collet or along the edges with a sharp pair of bent tweezers. Avoiding damaging the RF, DC, and ground contacts on the package bottom. Do not apply excessive pressure to the top of the lid.
- **Device Storage:** Devices are supplied in heat-sealed, moisture-barrier bags. In this condition, devices are protected and require no special storage conditions. Once the sealed bag has been opened, devices should be stored in a dry nitrogen environment.

#### Device Usage:

Fairchild recommends the following procedures prior to assembly.

- Dry-bake devices at 125°C for 24 hours minimum. Note: The shipping trays cannot withstand 125°C baking temperature.
- Assemble the dry-baked devices within 7 days of removal from the oven.
- During the 7-day period, the devices must be stored in an environment of less than 60% relative humidity and a maximum temperature of 30°C
- If the 7-day period or the environmental conditions have been exceeded, then the dry-bake procedure must be repeated.

#### Solder Materials & Temperature Profile:

Reflow soldering is the preferred method of SMT attachment. Hand soldering is not recommended.

#### Reflow Profile

- **Ramp-up:** During this stage the solvents are evaporated from the solder paste. Care should be taken to prevent rapid oxidation (or paste slump) and solder bursts caused by violent solvent out-gassing. A typical heating rate is 1-2°C/sec.
- **Pre-heat/soak:** The soak temperature stage serves two purposes; the flux is activated and the board and devices achieve a uniform temperature. The recommended soak condition is: 120–150 seconds at 150°C.
- **Reflow Zone:** If the temperature is too high, then devices may be damaged by mechanical stress due to thermal mismatch or there may be problems due to excessive solder oxidation. Excessive time at temperature can enhance the formation of inter-metallic compounds at the lead/board interface and may lead to early mechanical failure of the joint. Reflow must occur prior to the flux being completely driven off. The duration of peak reflow temperature should not exceed 10 seconds. Maximum soldering temperatures should be in the range 215–220°C, with a maximum limit of 225°C.
- **Cooling Zone:** Steep thermal gradients may give rise to excessive thermal shock. However, rapid cooling promotes a finer grain structure and a more crack-resistant solder joint. The illustration below indicates the recommended soldering profile.

#### Solder Joint Characteristics:

Proper operation of this device depends on a reliable void-free attachment of the heat sink to the PWB. The solder joint should be 95% void-free and be a consistent thickness.

#### Rework Considerations:

Rework of a device attached to a board is limited to reflow of the solder with a heat gun. The device should not be subjected to more than 225°C and reflow solder in the molten state for more than 5 seconds. No more than 2 rework operations should be performed.
