

## Description

The WS2512, a Wide-band Code Division Multiple Access (WCDMA) Power Amplifier (PA), is a fully matched 10-pin surface mount module developed for WCDMA handset applications. This power amplifier module operates in the $1920-1980 \mathrm{MHz}$ bandwidth. The WS2512 meets the stringent WCDMA linearity requirements for output power of up to 28 dBm . A low current (Vcont) pin is provided for high efficiency improvement of the low output power range.

## Agilent WS2512 $4 \times 4$ Power Amplifier Module for UMTS2100 (1920-1980 MHz) Data Sheet

The WS2512 features CoolPAM Circuit technology offering state-of-the-art reliability, temperature stability and ruggedness.

The WS2512 is self contained, incorporating 50 ohm input and output matching networks.

## Features

- CoolPAM circuit technology
- Good linearity
- High efficiency
- 10-pin surface mounting package ( $4 \mathrm{~mm} \times 4 \mathrm{~mm} \times 1.4 \mathrm{~mm}$ )
- Low power-state control
- Low quiescent current
- Internal $50 \Omega$ matching networks for both RF input and output

## Applications

- W-CDMA handsets
- HSDPA handsets

## Functional Block Diagram

## Agilent Technologies

Table 1. Absolute Maximum Ratings ${ }^{[1]}$

| Parameter | Symbol | Min. | Typical | Max. | Unit |
| :--- | :--- | :--- | :--- | :--- | :--- |
| RF Input Power | $\mathrm{P}_{\text {in }}$ | - | - | 10.0 | dBm |
| DC Supply Voltage | $\mathrm{V}_{\text {cc }}$ | - | 3.4 | 5.0 | V |
| DC Reference Voltage | $\mathrm{V}_{\text {ref }}$ | - | 2.85 | 3.3 | V |
| Storage Temperature | $\mathrm{T}_{\text {stg }}$ | -55 | - | +125 | ${ }^{\circ} \mathrm{C}$ |

Table 2. Recommended Operating Conditions

| Parameter | Symbol | Min. | Typical | Max. | Unit |
| :--- | :--- | :--- | :--- | :--- | :--- |
| DC Supply Voltage |  |  |  |  |  |
| -Mid/High Power Mode | $\mathrm{V}_{\text {cc }}$ | 3.2 | 3.4 | 4.2 | V |
| - Low Power Mode |  |  |  |  |  |

Table 3. Power Range Truth Table

| Power Mode | Symbol | Vref | Vcont ${ }^{[2]}$ | Vcc | Range |
| :--- | :--- | :--- | :--- | :--- | :--- |
| High Power Mode ${ }^{[3]}$ | PR3 | 2.85 | Low | 3.4 | $\sim 28 \mathrm{dBm}$ |
| Mid Power Mode $^{[3]}$ | PR2 | 2.85 | High | 3.4 | $\sim 16 \mathrm{dBm}$ |
| Low Power Mode $^{[3]}$ | PR1 | 2.85 | High | 1.5 | $\sim 7 \mathrm{dBm}$ |
| Shut Down Mode $^{[4]}$ | - | 0.00 | - | 3.4 | - |

## Notes:

1. No damage assuming only one parameter is set at limit at a time with all other parameters set at or below nominal value
2. High $(1.5 \mathrm{~V}-3.0 \mathrm{~V})$, Low $(0.0 \mathrm{~V}-0.5 \mathrm{~V})$.
3. To change between High Power Mode and Low Power Mode, switch Vcont accordingly.
4. In order to shut down the module, turn off Vref accordingly.

Table 4. Electrical Characteristics for WCDMA Mode (Vref=2.85V, Vcc $=3.4 \mathrm{~V}$, $\left.\mathrm{Temp}=+25^{\circ} \mathrm{C}\right)^{[1]}$

## Notes:

1. Electrical characteristics are specified under HSDPA modulated Up-Link signal (DPCCH/DPDCH=12/15, HS-DPCCH/DPDCH=15/15) unless specified otherwise.
2. Specified under WCDMA modulated (3GPP Uplink DPCCH + 1DPDCH) signal.
3. Control current when series 6.2 kohm is used.
4. ACP is expressed as a ratio of total adjacent power to signal power, both with 3.84 MHz bandwidth at specified offsets.

Table 4, continued. Electrical Characteristics* $\left(\text { Vref }=2.85 \mathrm{~V}, \mathrm{Vcc}=3.4 \mathrm{~V} \text {, Temp }=+25^{\circ} \mathrm{C}\right)^{[2]}$

| Characteristics |  | Symbol | Condition | Min. | Typ. | Max. | Unit |

|  | RF | ToffDC |  | - | 1 | - | $\mu \mathrm{s}$ |

## Notes:

5. TswhighDC, TswlowDC is time required to reach stable quiescent bias $(10 \%)$ after Vcont is switched low and high, respectively. TswhighRF, TswlowRF is time required to reach final output power ( $\pm 1 \mathrm{~dB}$ ) after Vcont is switched low and high, respectively. TonDC is time required to reach stable quiescent bias ( $10 \%$ ) after Vref is switched high.
6. ToffDC is time required for the current to be less than $10 \%$ of the Iq after Vref is switched low. TonRF is time required to reach final output power ( $\pm 1 \mathrm{~dB}$ ) after Vref is switched high. ToffRF is time required to output power to drop 30dB after Vref is switched low.

Characteristics Data (HSDPA, Control scheme: 3-mode control, Vcc $=3.4 \mathrm{~V}$, Vref $=2.85 \mathrm{~V}, \mathrm{~T}=25^{\circ} \mathrm{C}$, Fo $=1950 \mathrm{MHz}$ )

## Package Dimensions and Pin Descriptions, continued

Figure 20. Marking Specification.

## Peripheral Circuit in Handset

Figure 21. Peripheral Circuit.

## Notes:

1. Recommended voltage for Vref is 2.85 V .
2. Place C1 near to Vref pin.
3. Place C 3 and C 4 close to pin $1(\mathrm{Vcc} 1)$ and pin $10(\mathrm{Vcc} 2)$. These capacitors can affect the RF performance.
4. Use $50 \Omega$ transmission line between PAM and Duplexer and make it as short as possible to reduce conduction loss
5. $\pi$-type circuit topology is good to use for matching circuit between PA and Duplexer.
6. Pull-up resistor (R1) should be used to limit current drain. 6.2 kohm is recommended for WS2512

## Calibration

Calibration procedure is shown in Figure 22. CoolPAM requires two calibration tables for high mode and low mode respectively. This is due to gain difference in each mode.

For continuous output power at the points of mode change, the input power should be adjusted according to gain step during the mode change.

## Offset Value

(difference between rising point and falling point)
Offset value, which is the difference between the rising point (output power where PA mode changes from low mode to high mode) and falling point (output power where PA mode changes from high mode to low mode), should be set to prevent system oscillation. 3 to 5 dB is recommended for Hysteresis.

## Average Current \& Talk Time

Probability Distribution Function implies that what is important for longer talk time is the efficiency of low or medium power range rather than the efficiency at full power. WS2512 idle current is 13 mA and operating current at 16 dBm is 54 mA at nominal condition. Average current calculated with CDMA PDF is 26 mA in urban area and 43 mA in suburban area for 2 -mode control. Average current can be reduced with 3 -mode control, which results in 20 mA in urban area and 38 mA in suburban area. This PA with low current consumption prolongs talk time by no less than 30 minutes compared to other PAs.

Average current $=\int(P D F \times$ Current $) d p$

Figure 22. Calibration procedure.

Figure 23. Setting of offset between rising and falling power.

Figure 24. CDMA Power Distribution Function.

## PCB Design Guidelines

The recommended WS2512 PCB Land pattern is shown in Figure 25 and Figure 26. The substrate is coated with solder mask between the I/O and conductive paddle to protect the gold pads from short circuit that is caused by solder bleeding/bridging.

## Stencil Design Guidelines

A properly designed solder screen or stencil is required to ensure optimum amount of solder paste is deposited onto the PCB pads.

The recommended stencil layout is shown in Figure 27. Reducing the stencil opening can potentially generate more voids. On the other hand, stencil openings larger than $100 \%$ will lead to excessive solder paste smear or bridging across the I/O pads or conductive paddle to adjacent I/O pads. Considering the fact that solder paste thickness will directly affect the quality of the solder joint, a good choice is to use laser cut stencil composed of 0.100 mm ( 4 mils ) or 0.127 mm (5mils) thick stainless steel which is capable of producing the required fine stencil outline.

Figure 25. Metallization.

Figure 26. Solder Mask Opening.

Figure 27. Solder Paste Stencil Aperature.

## Power control scheme

## - 2-mode control scheme

This control scheme doesn't require DC-DC converter. Vcont changes PA into Low Power Mode or High Power Mode, which results in 2-mode control without DC-DC converter. WS2512 is designed to change the mode at 16 dBm output power.

## - 3-mode control scheme

This control scheme requires DC-DC converter. When DC-DC converter is used, Vcc voltage as well as Vcont can be changed, which results in 3-mode control scheme - Low/Mid/High power mode. Vcc changes at 7 dBm output and Vcont changes at 16 dBm output. Voltages for Vcc are 1.5 V for low power mode and 3.4 V (battery voltage) for mid and high power mode.

PAE graphs for 2-mode control and 3-mode control are shown in Figure 28 and Figure 29.

## HSDPA

WS2512 meets stringent HSDPA linearity requirement up to 27 dBm . WS2512 can operate up to 28.5 dBm with Rel.99, which has a lower PAR (peak-to-average ratio) than HSDPA.

Table 5. Control scheme: 2-mode control

| Power Mode | Vref | Vcont | Vcc | Power range |
| :--- | :--- | :--- | :--- | :--- |
| High Power Mode | 2.85 | Low | 3.4 | $\sim 28 \mathrm{dBm}$ |
| Low Power Mode | 2.85 | High | 3.4 | $\sim 16 \mathrm{dBm}$ |
| Shut Down Mode | 0.00 | - | 3.4 | - |

Table 6. Control scheme: 3-mode control (DC-DC Converter Compatible)

| Power Mode | Vref | Vcont | Vcc | Power range |

all dimensions are in millimeters
Figure 31. Plastic Reel Format-13"/14".

## Handling and Storage

## ESD (Electrostatic Discharge)

Electrostatic discharge occurs naturally in the environment. With the increase in voltage potential, the outlet of neutralization or discharge will be sought. If the acquired discharge route is through a semiconductor device, destructive damage will result.

ESD countermeasure methods should be developed and used to control potential ESD damage during handling in a factory environment at each manufacturing site.

## MSL (Moisture Sensitivity Level)

Plastic encapsulated surface mount package is sensitive to damage induced by absorbed moisture and temperature. Agilent Technologies follows JEDEC Standard J-STD 020B. Each component and package type is classified for moisture sensitivity by soaking a known dry package at various temperatures and relative humidity, and times. After soak, the components are subjected to three consecutive simulated reflows.

The out of bag exposure time maximum limits are determined by the classification test
described below which corresponds to a MSL classification level 6 to 1 according to the JEDEC standard IPC/JEDEC J-STD-020B and J-STD-033.

WS2512 is MSL3. Thus, according to the J-STD-033 p. 11 the maximum Manufacturers Exposure Time (MET) for this part is 168 hours. After this time period, the part would need to be removed from the reel, de-taped and then re-baked.

MSL classification reflow temperature for the WS2512 is targeted at $250^{\circ} \mathrm{C}+0 /-5^{\circ} \mathrm{C}$. Figure 32 and Table 9 show typical SMT profile for maximum temperature of $250+0 /-5^{\circ} \mathrm{C}$.

Table 7. ESD Classification

| Pin\# | Name | Description | HBM | CDM | Classification |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | Vcc1 | Supply Voltage | $\pm 2000 \mathrm{~V}$ | $\pm 200 \mathrm{~V}$ | Class 2 |
| 2 | RF In | RF Input | $\pm 2000 \mathrm{~V}$ | $\pm 200 \mathrm{~V}$ | Class 2 |
| 3 | GND | Ground | $\pm 2000 \mathrm{~V}$ | $\pm 200 \mathrm{~V}$ | Class 2 |
| 4 | Vcont | Control Voltage | $\pm 2000 \mathrm{~V}$ | $\pm 200 \mathrm{~V}$ | Class 2 |
| 5 | Vref | Reference Voltage | $\pm 2000 \mathrm{~V}$ | $\pm 200 \mathrm{~V}$ | Class 2 |
| 7 | GND | Ground | $\pm 2000 \mathrm{~V}$ | $\pm 200 \mathrm{~V}$ | Class 2 |
| 8 | GND | Ground | $\pm 2000 \mathrm{~V}$ | $\pm 200 \mathrm{~V}$ | Class 2 |
| 9 | RFOut | RF Output | $\pm 2000 \mathrm{~V}$ | $\pm 200 \mathrm{~V}$ | Class 2 |
| 10 | GND | Ground | $\pm 2000 \mathrm{~V}$ | $\pm 200 \mathrm{~V}$ | Class 2 |

Note:

1. Module products should be considered extremely ESD sensitive.

Table 8. Moisture Classification Level and Floor Life

| MSL Level | Floor Life (out of bag) at factory ambient $\leq \mathbf{3 0}{ }^{\circ} \mathbf{C} / \mathbf{6 0 \%} \mathbf{R H}$ or as stated |
| :--- | :--- |

| Tsmax to $T_{L}$ |  |  |
| - Ramp-up Rate |  | $3^{\circ} \mathrm{C} / \mathrm{sec}$ max |
| Time maintained above: |  |  |
| - Temperature ( $\mathrm{T}_{\mathrm{L}}$ ) | $183^{\circ} \mathrm{C}$ | $217{ }^{\circ} \mathrm{C}$ |
| - Time ( $\mathrm{T}_{\mathrm{L}}$ ) | 60-150 sec | $60-150 \mathrm{sec}$ |
| Peak Temperature ( $\mathrm{T}_{\mathrm{p}}$ ) | $225+0 /-5^{\circ} \mathrm{C}$ | $250+0 /-5^{\circ} \mathrm{C}$ |
| Time within $5^{\circ} \mathrm{C}$ of actual Peak Temperature (tp) | 10-30 sec | $10-30 \mathrm{sec}$ |
| Ramp-down Rate | $6^{\circ} \mathrm{C} / \mathrm{sec}$ max | $6^{\circ} \mathrm{C} / \mathrm{sec}$ max |
| Time $25^{\circ} \mathrm{C}$ to Peak Temperature | 6 min max | 8 min max |

## Storage Conditions

Packages described in this document must be stored in sealed moisture barrier, antistatic bags. Shelf life in a sealed moisture barrier bag is 12 months at $\angle 40^{\circ} \mathrm{C}$ and $90 \%$ relative humidity ( RH )
J-STD-033 p.7.

## Out-of-Bag Time Duration

After unpacking the device must be soldered to the PCB within 168 hours as listed in the J-STD-020B p. 11 with factory conditions $<30^{\circ} \mathrm{C}$ and $60 \% \mathrm{RH}$.

## Baking

It is not necessary to re-bake the part if both conditions (storage conditions and out-of-bag conditions) have been satisfied. Baking must be done if at least one of the conditions above have not been satisfied. The baking conditions are $125^{\circ} \mathrm{C}$ for 12 hours J-STD-033 p.8.

CAUTION: Tape and reel materials typically cannot be baked at the temperature described above. If out-of-bag exposure time is exceeded, parts must be baked for a longer time at low temperatures, or the parts must be de-reeled, de-taped, re-baked and then put back on tape and reel. (See moisture sensitive warning label on each shipping bag for information of baking).

## Board Rework

## Component Removal, Rework and Remount

If a component is to be removed from the board, it is recom-
mended that localized heating be used and the maximum body temperatures of any surface mount component on the board not exceed $200^{\circ} \mathrm{C}$. This method will minimize moisture related component damage. If any component temperature exceeds $200^{\circ} \mathrm{C}$, the board must be baked dry per 4-2 prior to rework and/ or component removal. Component temperatures shall be measured at the top center of the package body. Any SMD packages that have not exceeded their floor life can be exposed to a maximum body temperature as high as their specified maximum reflow temperature.

## Removal for Failure Analysis

Not following the above requirements may cause moisture/ reflow damage that could hinder or completely prevent the determination of the original failure mechanism.

## Baking of Populated Boards

Some SMD packages and board materials are not able to withstand long duration bakes at $125^{\circ} \mathrm{C}$. Examples of this are some FR-4 materials, which cannot withstand a 24 hr bake at $125^{\circ} \mathrm{C}$. Batteries and electrolytic capacitors are also temperature sensitive. With component and board temperature restrictions in mind, choose a bake temperature from Table 4-1 in J-STD 033; then determine the appropriate bake duration based on the component to be removed. For additional considerations see IPC-7711 and IPC-7721.

## Derating due to Factory Environmental Conditions

Factory floor life exposures for SMD packages removed from the dry bags will be a function of the ambient environmental conditions. A safe, yet conservative, handling approach is to expose the SMD packages only up to the maximum time limits for each moisture sensitivity level as shown in Table 8. This approach, however, does not work if the factory humidity or temperature are greater than the testing conditions of $30^{\circ} \mathrm{C} / 60 \% \mathrm{RH}$. A solution for addressing this problem is to derate the exposure times based on the knowledge of moisture diffusion in the component packaging materials (ref. JESD22-A120). Recommended equivalent total floor life exposures can be estimated for a range of humidities and temperatures based on the nominal plastic thickness for each device. Table 10 lists equivalent derated floor lives for humidity's ranging from $20-90 \% \mathrm{RH}$ for three temperatures, $20^{\circ} \mathrm{C}, 25^{\circ} \mathrm{C}$, and $30^{\circ} \mathrm{C}$. This table is applicable to SMDs molded with novolac, biphenyl or multifunctional epoxy mold compounds. The following assumptions were used in calculating Table 10 :

1. Activation Energy for diffusion $=0.35 \mathrm{eV}$ (smallest known value).
2. For $\leq 60 \%$ RH, use Diffusivity $=$ $0.121 \exp (-0.35 \mathrm{eV} / \mathrm{kT}) \mathrm{mm} 2 / \mathrm{s}$ (this uses smallest known Diffusivity @ $30^{\circ} \mathrm{C}$ ).
3. For $>60 \%$ RH, use Diffusivity $=$ $1.320 \exp (-0.35 \mathrm{eV} / \mathrm{kT}) \mathrm{mm} 2 / \mathrm{s}$ (this uses largest known Diffusivity @ $30^{\circ} \mathrm{C}$ ).

Handling and Storage, continued
Table 10. Recommended Equivalent Total Floor Life (days) @ $20^{\circ} \mathrm{C}, 25^{\circ} \mathrm{C} \& 3^{\circ} \mathrm{C}$ For ICs with Novolac, Biphenyl and Multifunctional Epoxies (Reflow at same temperature at which the component was classified)

| Maximum Percent Relative Humidity |  |  |  |  |  |  |  |  |  |  |  |  |
