

Low-Cost, 900MHz, Low-Noise Amplifier and Downconverter Mixer

General Description

The MAX2685's low-noise amplifier (LNA) and down-converter mixer comprise the major blocks of an RF front-end receiver. Optimized for 900MHz operation, the device's low noise figure, high gain, and high linearity make it ideal for cellular, cordless, and wireless data applications. A low supply current of 8.5mA (high-gain mode) and 3.8mA (low-gain mode) plus a low operating supply voltage range of +2.7V to +5.5V make it suitable for use in 3-cell NiCd or 1-cell lithium-ion (Li+) battery applications. A low-power shutdown mode further extends battery life by reducing supply current below 0.1 μ A.

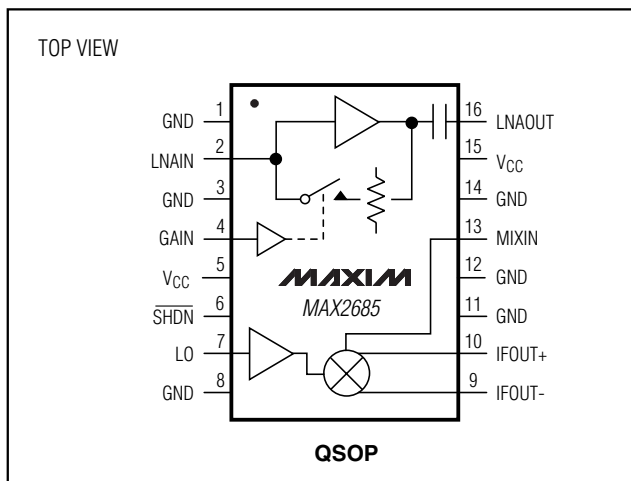

The MAX2685 includes an LNA, LNA bypass switch, downconverter mixer, and local-oscillator (LO) buffer. The LNA has a low noise figure of 1.4dB, a high gain of 15dB, and an input third-order intercept point (IP3) of -4dBm. The mixer has a noise figure of 13dB, a gain of 6dB, and an input IP3 of +7dBm. In addition, an LNA bypass switch allows two levels of gain, reducing power consumption when high gain is not needed.

The downconverter mixer has a single-ended RF input port and differential IF output ports. Differential operation of the IF ports offers improved even-order harmonic rejection and increased immunity to noise. An LO buffer allows the LO port to be driven with only -8dBm of LO power. The MAX2685 is offered in a space-saving 16-pin QSOP package.

Applications

Cellular/Cordless Phones	900MHz ISM-Band Radios
Wireless Data	868MHz European ISM Band

Pin Configuration

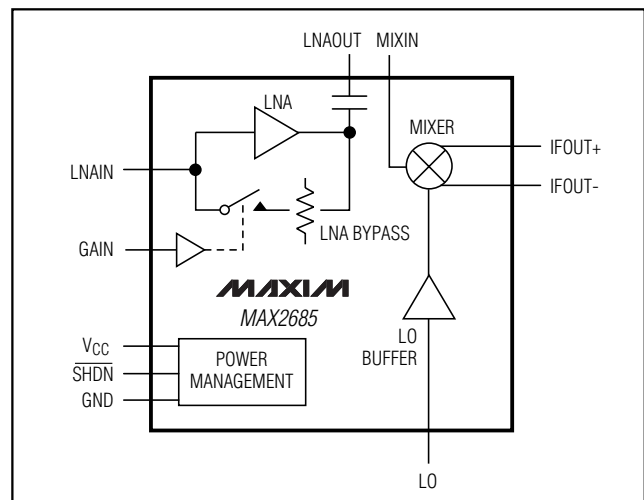

Features

- ◆ 800MHz to 1000MHz RF Frequency Range
- ◆ +2.7V to +5.5V Single-Supply Operation
- ◆ Integrated LNA + Mixer + LO Buffer
- ◆ Logic-Controlled LNA Bypass Switch Reduces Supply Current
- ◆ LNA Performance (High/Low Gain)
 - Gain: +15dB/-12dB
 - NF: 1.4dB/12dB
 - Input IP3: -4dBm/+16dBm
- ◆ Mixer Performance (High/Low Gain)
 - Gain: 6dB/4.6dB
 - NF: 13dB/12dB
 - Input IP3: +7dBm/-1.5dBm
- ◆ Supply Current
 - 8.5mA (High Gain)
 - 3.8mA (Low Gain)
- ◆ <0.1 μ A Supply Current in Shutdown Mode
- ◆ 0.8 μ s Receiver Enable Time

Ordering Information

Low-Cost, 900MHz, Low-Noise Amplifier and Downconverter Mixer

Pin Description

PIN	NAME	FUNCTION
1, 3, 8, 11, 12, 14	GND	Ground. Connect to ground plane with a low-inductance connection.
2	LNAIN	RF Input to LNA and LNA Bypass Switch. Requires an external matching network and a series DC-blocking capacitor.
4	GAIN	Gain Control Logic-Level Input. Drive high to enable the LNA, open the LNA bypass switch, and increase the receiver's gain. Drive low to disable the LNA, close the LNA bypass switch, and reduce the receiver's gain.
5, 15	V _{CC}	Supply Voltage. Bypass V _{CC} to GND at each pin with a 47pF capacitor as close to the pin as possible.
6	$\overline{\text{SHDN}}$	Shutdown Control Logic-Level Input. Drive high or connect to V _{CC} for normal operation. Drive low to place the device in low-power shutdown mode.
7	LO	Local-Oscillator Input to Downconverter Mixer. Requires a series DC-blocking capacitor and an impedance-setting resistor (typically 75Ω to ground).
9	IFOUT-	Inverting Side to Downconverter Mixer's Differential Open-Collector IF Output. Requires a pull-up inductor to V _{CC} for proper biasing, as well as a matching network to ensure optimum output power.
10	IFOUT+	Noninverting Side of Downconverter Mixer's Differential Open-Collector IF Output. Requires a pull-up inductor to V _{CC} for proper biasing, as well as a matching network to ensure optimum output power.
13	MIXIN	RF Input to Downconverter Mixer. Requires an external matching network and series DC-blocking capacitor.
16	LNAOUT	LNA Output. Internally matched to 50Ω. LNAOUT has an internal blocking capacitor.

Figure 1. Typical Operating Circuit

Low-Cost, 900MHz, Low-Noise Amplifier and Downconverter Mixer

Detailed Description

The MAX2685 consists of five major components: a low-noise amplifier (LNA), an LNA bypass switch, a downconverter mixer, a local-oscillator (LO) buffer, and a power-management block.

Low-Noise Amplifier (LNA)

The LNA is a wideband, single-ended cascode amplifier that operates over a wide range of frequencies. The input of the LNA (LNAIN) requires an appropriate matching network and a DC-blocking capacitor. The typical operating circuit shown in Figure 1 is optimized for frequencies around 880MHz, requiring only a 0.1 μ F capacitor in series with a 12nH inductor. See Table 1 for the LNA "S" parameters for matching to other frequencies.

The output of the LNA (LNAOUT) is internally biased to VCC. It is internally matched to 50 Ω and incorporates an internal DC-blocking capacitor.

LNA Bypass Switch and Gain Control

When a large input signal is present, enable the LNA bypass function to increase linearity and reduce supply current. Set GAIN low to enable the LNA bypass function.

Receive Mixer

The downconverter mixer is a wideband, single-balanced design with a low noise figure and high linearity. The RF signal at the MIXIN port is mixed with the signal at the LO port, and is downconverted to an IF frequency at the differential IF port.

RF Input

The MIXIN input requires a simple external matching network and a series DC-blocking capacitor. See Figure 1 for a matching network example, optimized for 880MHz operation. Table 2 lists mixer "S" parameters for matching to other frequencies.

Table 1. LNA Typical S-Parameters (VCC = +3V, TA = +25°C)

Low-Cost, 900MHz, Low-Noise Amplifier and Downconverter Mixer

Local-Oscillator Input

The LO port is the high-impedance input of the local-oscillator buffer. It requires a series DC-blocking capacitor and a shunt resistor to ground to set the input impedance. See the *Typical Operating Characteristics* for a graph of LO Port Return Loss vs. Frequency.

IF Output Port

The mixer's downconverted output appears on the differential IFOUT+ and IFOUT- pins. The differential output can be converted to a single-ended output, as shown in the MAX2685 evaluation kit (EV kit). Refer to the *Detailed Description* in the MAX2685 EV kit data sheet.

Shutdown

Drive $\overline{\text{SHDN}}$ low to disable all device functions and place the MAX2685 in low-power shutdown mode. Drive $\overline{\text{SHDN}}$ high or connect it to VCC to enable all device functions.

Applications Information

Layout Considerations

A properly designed PC board is an essential part of any RF/microwave circuit. Note the IC's high-frequency inputs and outputs, and be sure to decouple the DC supply and control pins.

For power-supply traces and connections, a star topology works well. Each VCC node in the circuit has its own path to the central VCC node and a decoupling capacitor that provides a low impedance at the RF frequency of interest. The central VCC also has a large decoupling capacitor. This provides good isolation between the different sections of the MAX2685.
