REFERENCE DATA

1. Life curve

2. Coil temperature rise (resistance method)

3. H<sub>2</sub>S gas test

4. Contact reliability

Test conditions:

1. Contact current/voltage: 10 μA 100 mV 1 kHz
2. Cycle rate 20 cps.
3. Miscontact detection level: 1 mW (= 100 Ω)
4. Detection method: Observation of all changeover contacts

Test result:

- m = 1.5
- μ = 21.2 × 10<sup>6</sup>
- 95% confidence level = 3.1 × 10<sup>6</sup>
- 17 contacts out of 20 achieved 10 million no miscontact operations.

5. High temperature test

Test conditions:

Ambient temperature: 80°C ±2°C

Test method:

1. All contacts were switched for 100 operations on 2 A 30 V DC resistive load.
2. Samples then were exposed to 80°C temperature for 5,000 hours, continuous
3. Contact resistance was measured with Hewlett-Packard testing equipment.

Test result:

Amber relays showed a stable spread of contact resistance within the initially specified 50 mΩ after 5,000 hours exposure.

NOTES

1. Prevention of vibration and shock

To reduce the likelihood of vibration and shock, we recommend that you install so that the contact action is not in the direction of gravity.
