

10A high-capacity PC board terminal type SSR added to lineup. Complies with VDE and EN60950-1 reinforced insulation requirement.

AQ1 RELAYS

FEATURES

1. 10A high-capacity realized for PC board terminal (with heat sink)

SSR for compact PC boards with 10 A capacity that is two times greater than our previous model. It is suitable for long-life, highly frequent control.

2. VDE (EN60950-1) reinforced insulation compliant

Fully satisfies demand for safety by guaranteeing compliance with EN60950-1 safety standard and featuring 3,000 V reinforced insulation (AQ3A2-ZT4/32VDC, AQ3A2-J-ZT4/32VDC and AQ10A2-ZT4/32VDC).

3. Superior anti-vibration and anti-shock characteristics

The body is molded as a single unit with flame resistant resin which makes it highly resistant against vibration and shock, and gives it superior protection from environment. The body can also be washed.

4. Vertical types with SIL terminal arrangement and flat types are available.

1) The vertical type is available in thicknesses of 10 mm (2 A and 3 A types) and 12 mm (5 A and 10 A types).

Terminal arrangement is SIL in integral multiples of 2.54 mm (0.1 inch).

2) The height of the flat type is 12 mm.

The terminal arrangement is DIL in integral multiples of 2.54 mm.

5. Reduced noise generation

The load will operate at close to zero voltage even when the input signal is applied during a cycle. Also, even if an input signal is cancelled during a cycle, the load is cut off at close to zero current.

For this reason, hardly any noise is produced and radio frequency interference (RFI) and electromagnetic interference (EMI) are kept to a minimum.

6. Built-in Snubber circuit prevents malfunction.

TYPICAL APPLICATIONS

- Printing machines
- Packing machines
- Traffic signal control
- Automatic ticket punchers
- Terminal equipment of data processing
- Computer peripherals
- NC machines

CAUTIONS FOR USE

1. Input side

1) Noise and surge protection at the input side

A high noise surge voltage applied to the SSR input circuit can cause malfunction or permanent damage to the device. If such a high surge is anticipated, use C or R noise absorber in the input circuit.

2) When the input terminals are connected with reverse polarity Reversing the polarity will not cause damage to the device, due to the presence of a protection diode, but the device will not operate.

3) In the case of operating voltage containing ripple

If the SSR control voltage contains ripple, the peak of the ripple should not exceed the maximum rated control voltage "32V", and the bottom of the ripple should exceed the minimum rated control voltage "4V".

2. Output side

1) Regarding output noise surge protection

A high noise surge voltage applied to the SSR load circuit can cause malfunction or permanent damage to the device. If such a high surge is anticipated, use a varistor across the SSR output.

Keep the varistor voltage to no more than 500 V.

2) When used for the load less than rated An SSR may malfunction if it is used below the specified load. In such an event, use a dummy resistor in parallel with the load.

Set a value of dummy resistor so that the load current becomes 50 mA or greater due to the dummy resistor and load.

3. When using bent output terminals

To avoid applying mechanical stress on the main unit and molded section of the solid state relay, radio pliers should be used to grasp the terminals between the point of bending and the molded case when making the bends.

4. When a heat sink is mounted on the 5 A or 10 A type

The heat sink (AQ-HS-5A) or a radiator which can make good contact should be used.

If a heat sink is used in which the contact condition is bad, a heat conducting compound should be used to improve the heat radiation. (Ex. Silicon compound Toshiba silicon YG6111 or TSK5303) The compound should be applied between the heat sink and the AQ1.

5. Others

1) If an SSR is used in close proximity to another SSR or heat-generating device, its ambient temperature may exceed the allowable level. Carefully plan SSR layout and ventilation.

2) Soldering to SSR terminals should be completed within 5 seconds at 260°C 500°F.

3) Terminal connections should be made by referring to the associated wiring diagram.

4) For higher reliability, check device quality under actual operating conditions.

6. Transportation and storage

1) Extreme vibration during transport will warp the lead or damage the relay. Handle the outer and inner boxes with care.

2) Storage under extreme conditions will cause soldering degradation, external appearance defects, and deterioration of the characteristics. The following storage conditions are recommended:

- Temperature: 5 to 30°C 41 to 86°F
- Humidity: Less than 60% R.H.
- Atmosphere: No harmful gasses such as sulfurous acid gas, minimal dust.

Panasonic Temperature Controllers

Our temperature controller is recommended for use with our Solid State Relays.

Features

- Data can be collected using the RS485 communications interface via a PLC.
- Improved visibility using a negative type LCD and backlight.
- Depth-wise length (chassis dimension) is 56 mm 2.205 inch.
