

#### DESCRIPTION

The LX1973A is a wide dynamic range light sensor with a very low dark current that is optimized for sensing low level light signals that typically occur under dark or darkening outdoor ambient lighting. The LX1973A has been optimized for automotive systems such as headlamp brightness control or rear view mirror contrast control. Its radical (fractional exponent) response when interfaced with an 8 bit DAC can detect levels down to 0.001 lux or levels as high as 500 lux.

The spectral response of the integrated light sensor closely emulates the human eye so it ignores light such as infrared which emits energy but doesn't aid vision. This eliminates the need for an Infrared filter required with competitor's light sensors.

## Notes:

1. The input irradiance is supplied from a point source which is a white light emitting diode (LED); Fairchild Semiconductor part number MV8W00.
2. See Figure 2.
3. See Figure 3.

4. Dark Current equivalent lux at 0 lux:  $EL = \left[ \frac{I_{OUT}}{I_{REF}} \right]^4 \div (146 \times 10^{-9})$

5. For Flat Top (DU Package),  $I_{REF} = 5824\mu\text{A}$ .

6. For Reverse Form (DR Package):  $I_{REF} = 5985\mu\text{A}$

## APPLICATIONS

### GENERAL DESCRIPTION

The LX1973A produces an output current that is sensitive to the level of ambient light that falls onto the photosensitive area of the IC package. The sensitivity is amplified and compressed to provide ratio metric accuracy across several decades. The sensitivity function is:

$$I_{OUT}(P) = \frac{I_{ref}}{lux^{0.25}} \times (E_{DARK} + E_{AMBIENT})^{0.25}$$

$I_{ref}$  = 113.8 $\mu$ A for the Flat Top package

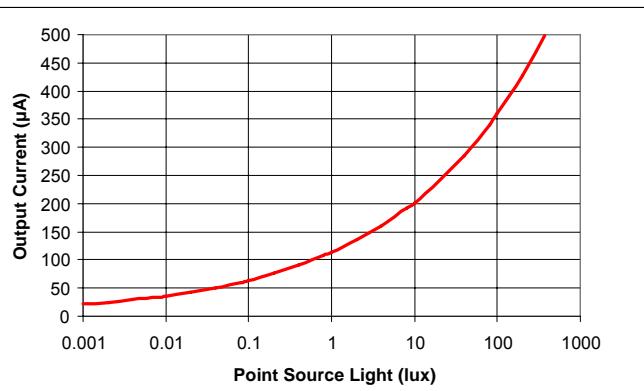

$I_{ref}$  = 117 $\mu$ A for the Reverse Flat Top package

$E_{DARK}$  = dark current equivalent lux expressed in lux from a white LED point source.

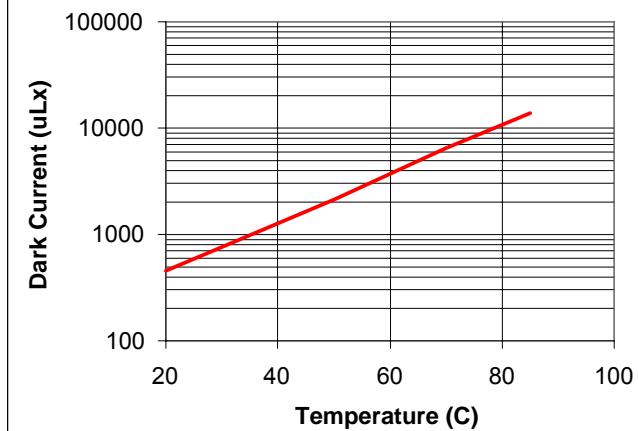

$E_{AMBIENT}$  = ambient illumination expressed in lux from a white LED point source.
