DATA SHEET

Overload protection for telecommunication **PTC thermistors**

2000 Oct 10

Supersedes data of 17th May 1999
File under BCcomponents, BC02

BC COMPONENTS

FEATURES

- Wide resistance range in telecom area 4... to 70 Ω
- Fast protection against power contact faults
- Withstand high overload currents of up to 10 A
- High voltage withstanding capabilities for the larger sized thermistors
- Good tracking over a wide temperature range for all matched or binned types
- UL1434 approved types available (XGPU2)
- Excellent stability over extended time
- All telecom PTCs are coated with a high temperature silicon lacquer (UL94V0) to protect them from any harsh environments and to improve their lifetime.

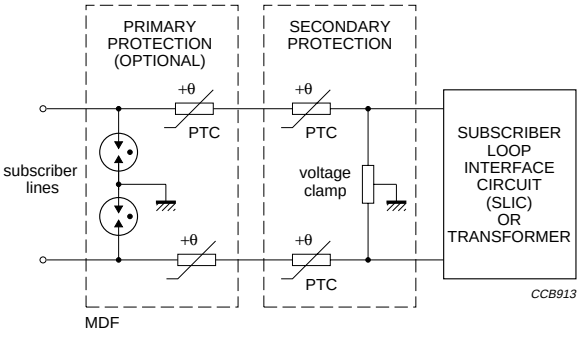

Fig.1 Typical telephone line equipment showing where PTC thermistors can be used for overcurrent protection.

APPLICATIONS

- Main Distribution Frame (MDF)
- Central Office Switching (C.O.)
- Subscriber Terminal Equipment (T.E.)
- Set-top box (S.B.).

DESCRIPTION

Advanced developments in telephony equipment in recent years have radically altered the protection requirements for both exchange and subscriber equipment. The BC Components range of Positive Temperature Coefficient (PTC) thermistors includes devices specially designed to provide overcurrent protection.

OVERCURRENT PROTECTION OF TELECOMMUNICATION LINES

The PTC thermistor must protect the telephone line circuit against overcurrent which may be caused by the following examples:

- Surges due to lightning strikes on or near to the line plant.
- Short-term induction of alternating voltages from adjacent power lines or railway systems, usually caused when these lines or systems develop faults.
- Direct contact between telephone lines and power lines.

To provide good protection under such conditions a PTC thermistor is connected in series with each line, usually as secondary protection; see Fig.1. However, even with primary line protection (usually a gas discharge tube), the PTC thermistor must fulfil severe requirements.

Surge pulses of up to 2 kV can occur and in order to withstand short-term power induction the PTC thermistor must withstand high voltages. If the line has primary protection a 220 V to 300 V PTC thermistor is adequate. Without primary protection, however, a 600 V PTC device is necessary. BCcomponents manufacturers a range of PTC thermistors (see Table 2) covering both requirements.

In the case of direct contact between the telephone line and a power line, the PTC thermistor must withstand very high inrush power at normal mains voltage. Under such conditions, overload currents of up to 10 A on a 230 V mains could occur for up to several hours. To handle this power, the resistance/temperature characteristic of the thermistor must have a very steep slope and the ceramic must be extremely homogeneous.

In case of overcurrent due to short-term induction of alternating voltages, currents of several AMPs with voltages as high as 650 V_{RMS} can be present for several seconds

For standard high voltage applications, resistance values from 25 to 50 Ω are available. However, ISDN networks which carry high-frequency sound and vision, need lower line impedance.

Telecommunication designers are therefore demanding high voltage thermistors with much lower R_{25} values, which places even greater demands on the manufacture of PTC thermistors. For these applications PTC thermistors which have a R_{25} value of 10 Ω with voltages in the 300 to 600 V_{RMS} range are available.

In a typical telephone line application, two PTC thermistors are used, one each for the tip and ring (or A and B) wire together with their series resistors. For good line balance it is important that the thermistor and resistor pairs are matched.

On request, BCcomponents can supply matched or binned PTC thermistors with R_{25} values matched to as close as 0.5 Ω.

MECHANICAL DATA

Table 1 Specific physical dimensions and packaging for catalogue numbers as listed; see Fig.2

D MAX. (mm)	T MAX. (mm)	H_2 (mm)	L_1 (mm)	H_3 MAX. (mm)	PACKAGING[1][2]	CATALOGUE NUMBER 2322 ... .

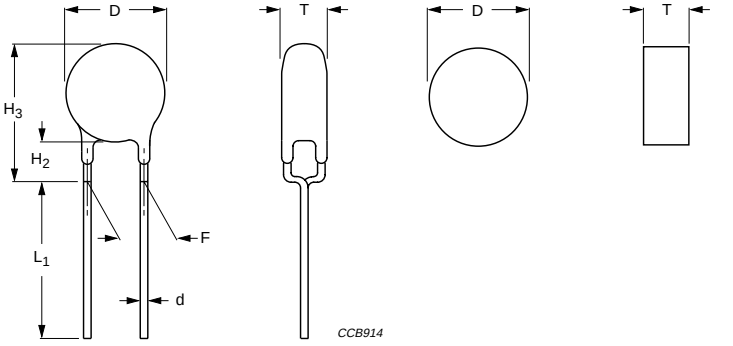
Notes

1. Taped in accordance with *"IEC 60286-2"*; standard packaging: 1500 units/reel.
2. Naked disc ceramic for substrate mounting, available on request.
3. Insulated version is also available.



For dimensions see Table 1.
Lead pitch F = 5 mm +0.6/–0.1.
Lead thickness d = 0.6 mm ±10%.

Fig.2 Component outline.
